

# JUPYTERLAB -SUPERCOMPUTING IN YOUR BROWSER

**Training course "Introduction to the usage and programming of supercomputer resources in Jülich"**

2020-11-25 | JENS. H. GÖBBERT (J.GOEBBERT@FZ-JUELICH.DE)

TIM KREUZER (T.KREUZER@FZ-JUELICH.DE)

# MOTIVATION

your thinking, your reasoning, your insides, your ideas

“It is all about using and building a machinery **interface** between computational researchers and data, supercomputers, laptops, cloud and your thinking, your reasoning, your insides, your ideas about a problem.”

Fernando Perez, Berkely Institute for Data Science  
Founder of Project Jupyter

jupyter

<https://jupyter.org>

Member of the Helmholtz Association

 JÜLICH  
Forschungszentrum

# MOTIVATION

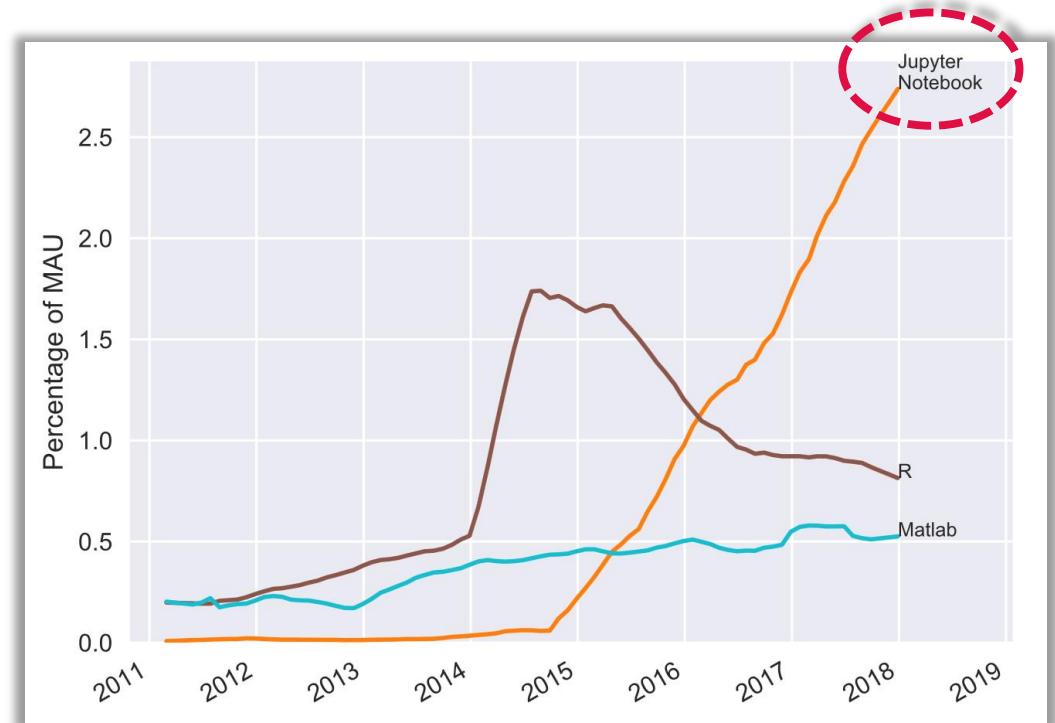

## Rise of Jupyter's popularity

If popularity can be counted by

- Monthly aggregated number of user interactions with GitHub repos (= Monthly Active Users (MAU))
- and
- Each repository is assigned to a single language (by looking at which language has the most bytes in the repo)

Jupyter Notebooks have seen significant and steady growth over the last years (still rising).

- Of course the popularity of Python in general is pushing this trend.

<https://www.benfrederickson.com/ranking-programming-languages-by-github-users/>  
<https://github.com/benfred/github-analysis>

# TERMINOLOGY

## What is JupyterLab

### JupyterLab

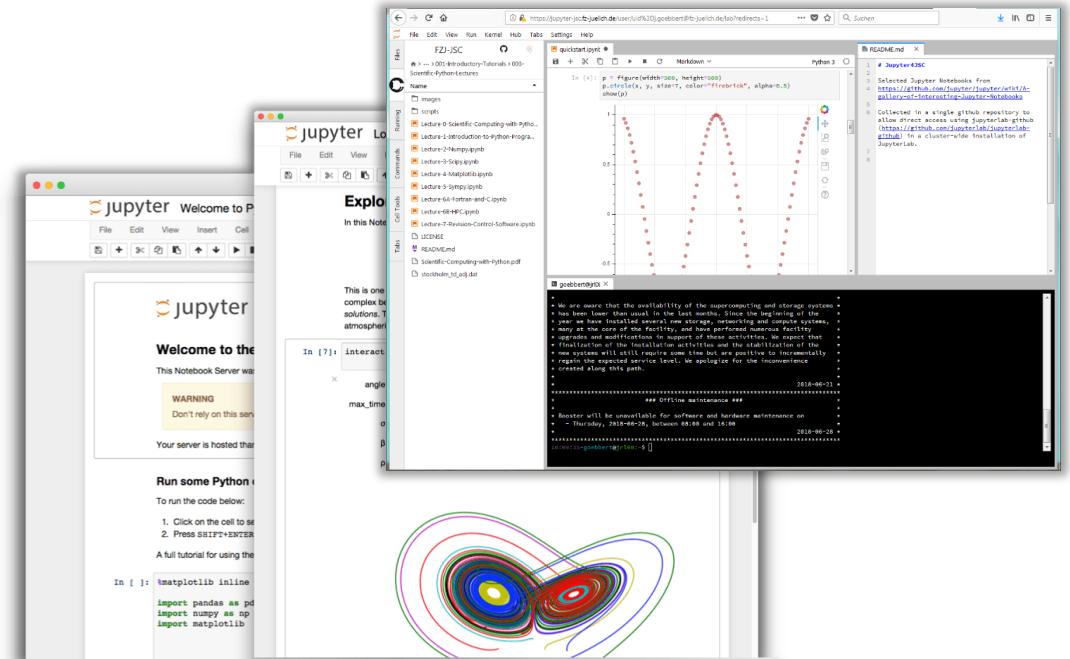

- **Interactive** working environment in the web browser
- For the creation of **reproducible** computer-aided narratives
- **Very popular** with researchers from all fields
- Jupyter = Julia + Python + R

Multi-purpose working environment

- Language agnostic
- Supports execution environments (“*kernels*”)
  - For dozens of languages: Python, R, Julia, C++, ...
- Extensible software design („*extensions*“)
  - many server/client plug-ins available
  - Eg. in-browser-terminal and file-browsing

Document-Centered Computing (“*notebooks*”)

- Combines code execution, rich text, math, plots and rich media.
- All-in-one document called Jupyter Notebook

<https://jupyterlab.readthedocs.io>

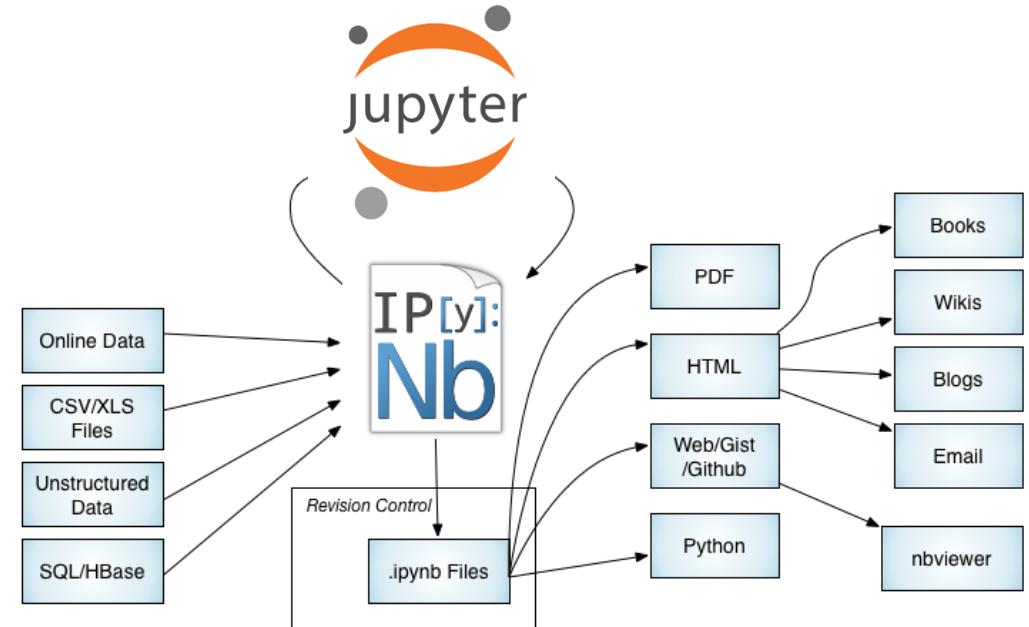

# TERMINOLOGY

## What is a Jupyter Notebook?

### Jupyter Notebook

A notebook document (file extension .ipynb)  
is a document that can be rendered in a web browser

- It is a file, which stores your work in JSON format
- Based on a set of open standards for interactive computing
- Allows development of custom applications with embedded interactive computing.
- Can be extended by third parties
- Directly convertible to PDF, HTML, LaTeX ...
- Supported by many applications such as GitHub, GitLab, etc..

<https://jupyter-notebook.readthedocs.io/>  
<https://github.com/jupyter/jupyter/wiki/A-gallery-of-interesting-Jupyter-Notebooks>

# TERMINOLOGY

## What is a Jupyter Kernel?

### Jupyter Kernel

A “kernel” refers to the separate process which executes code cells within a Jupyter notebook.

### Jupyter Kernel

- **run code** in different programming languages and environments.
- can be **connected to** a notebook (one at a time).
- **communicates** via ZeroMQ with the JupyterLab.
- Multiple **preinstalled** Jupyter Kernels can be found on our clusters
  - Python, R, Julia, Bash, C++, Ruby, JavaScript
  - Specialized kernels for visualization, quantumcomputing
- You can easily **create your own kernel** which for example runs your specialized virtual Python environment.

<https://jupyter-notebook.readthedocs.io/>  
<https://github.com/jupyter/jupyter/wiki/Jupyter-kernels>  
<https://zeromq.org>

# TERMINOLOGY

## What is a JupyterLab Extension?

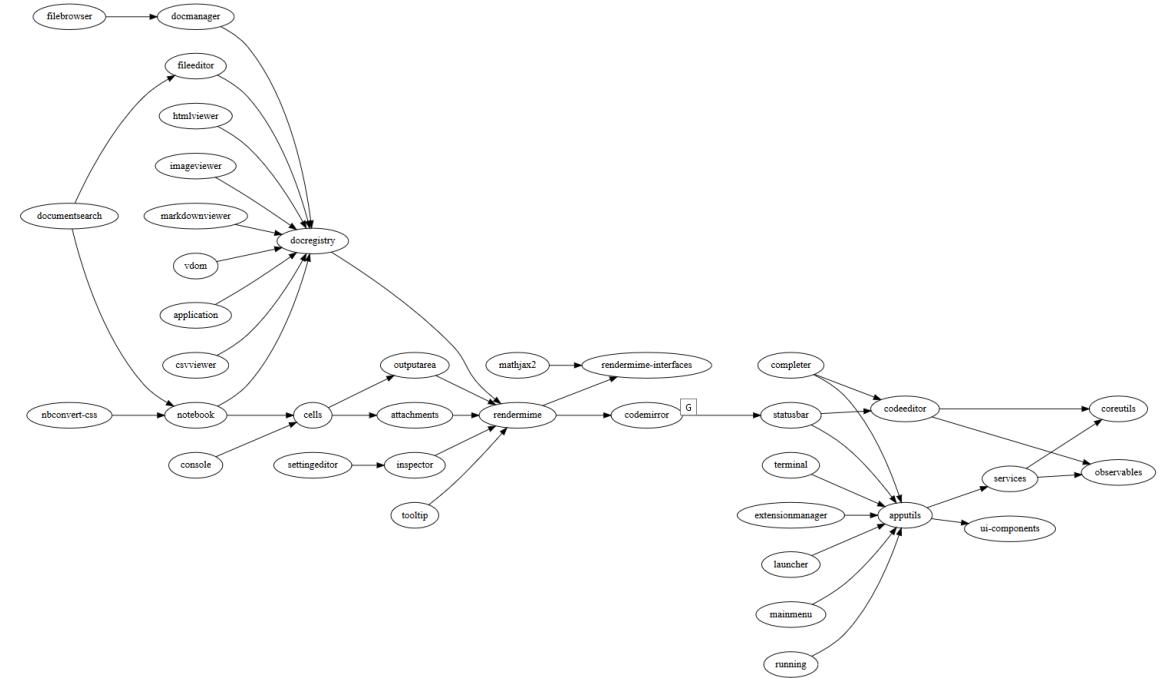

### JupyterLab Extension

JupyterLab extensions can customize or enhance any part of JupyterLab.

### JupyterLab Extensions

- provide new file viewers, editors, themes
- provide renderers for rich outputs in notebooks
- add items to the menu or command palette
- add keyboard shortcuts
- add settings in the settings system.
- Extensions can even provide an API for other extensions to use and can depend on other extensions.

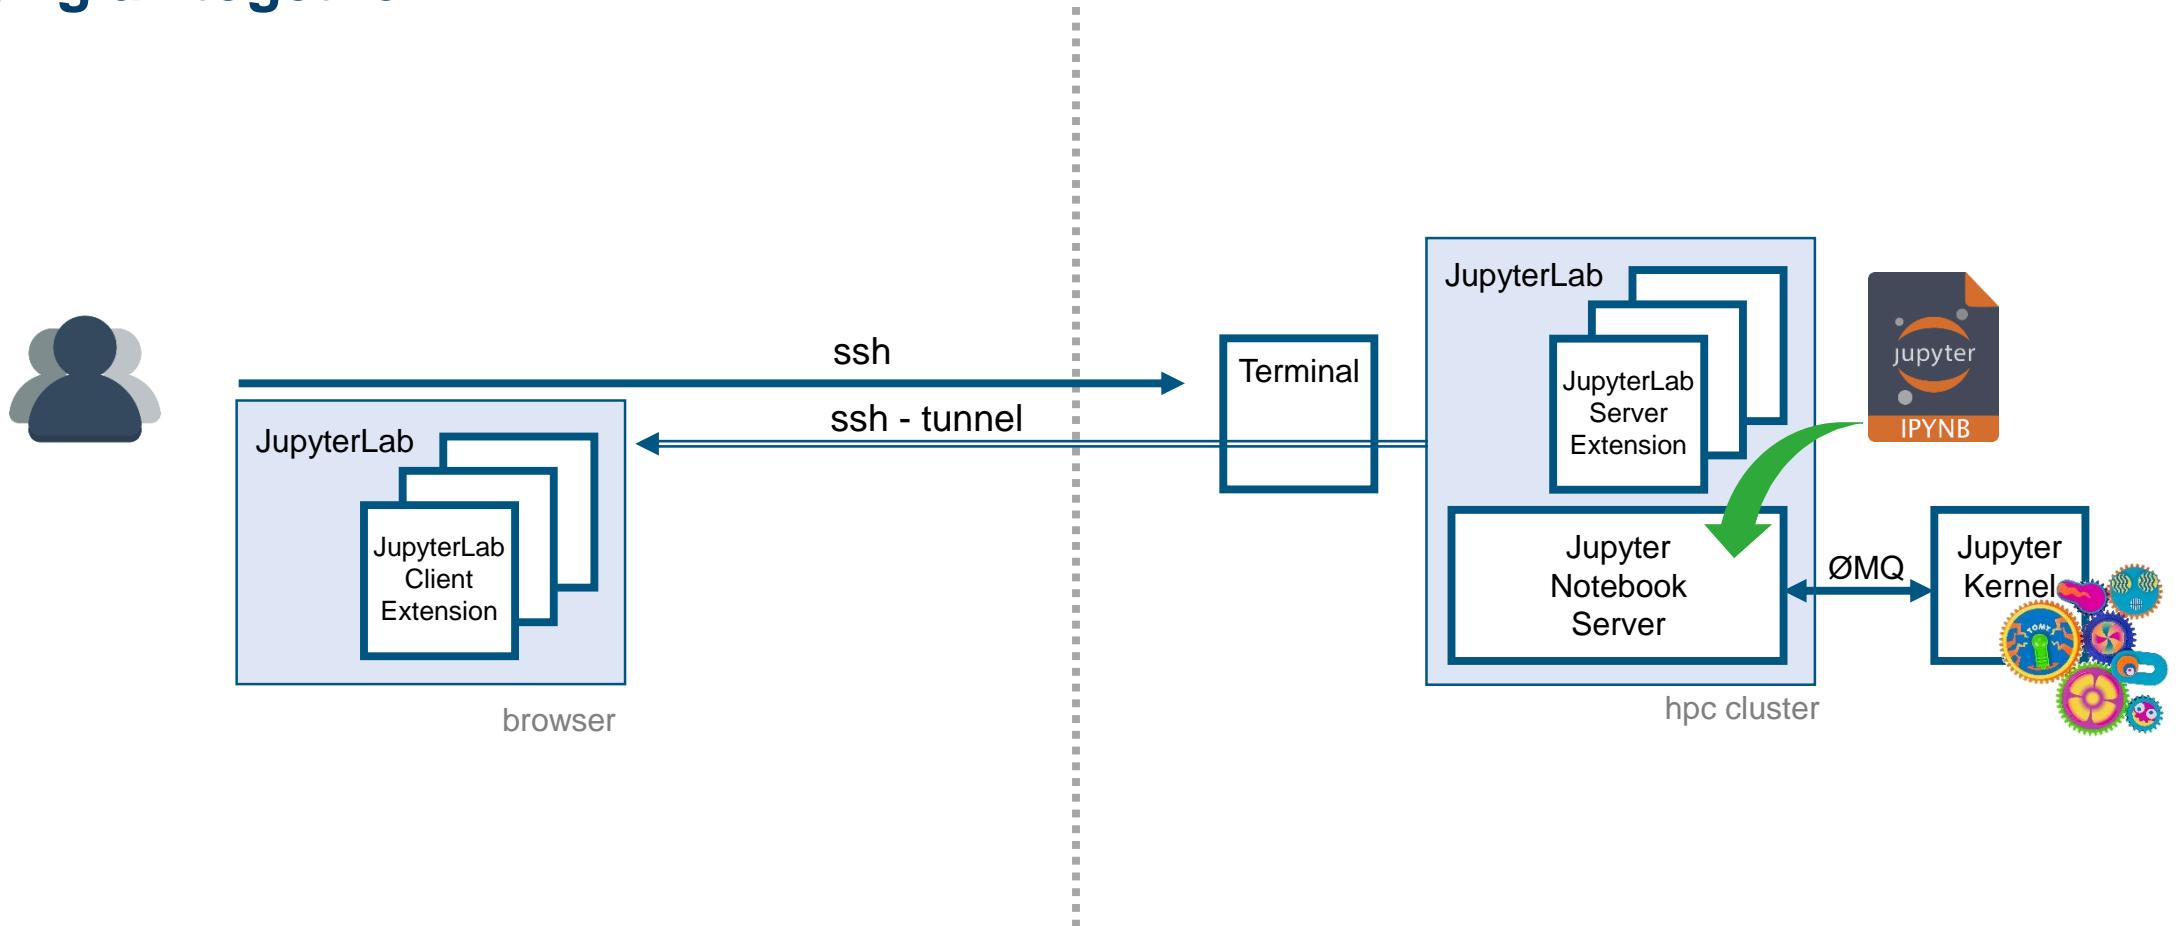

The whole JupyterLab itself is simply a **collection of extensions** that are no more powerful or privileged than any custom extension.

<https://jupyterlab.readthedocs.io/en/stable/user/extensions.html>  
<https://github.com/topics/jupyterlab-extension>

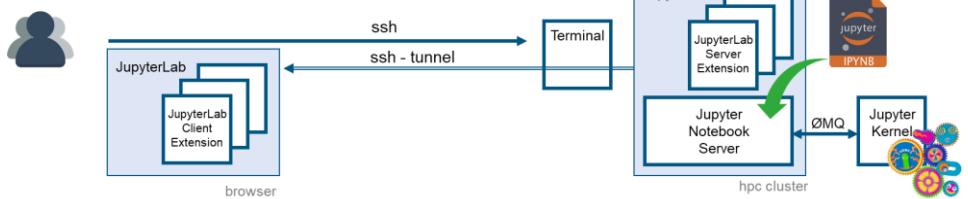

# TERMINOLOGY

## Bringing all together

# JUPYTER – START & TUNNEL

## Start your JupyterLab (the hard way)

### Start Jupyter on the login node

```
Lnode:> module purge  
Lnode:> module use $OTHERSTAGES  
Lnode:> module load Stages/Devel-2019a  
Lnode:> module load GCC/8.3.0  
Lnode:> module load JupyterCollection/2019a.2.4  
  
Lnode:> cd $PROJECT_<my_project>  
Lnode:> jupyter lab
```

[I 20:44:05.916 NotebookApp] Writing notebook server cookie secret to  
/run/user/12885/jupyter/notebook\_cookie\_secret

[...]

Copy/paste this URL into your browser when you connect for the first time, to  
login with a token:

<http://localhost:8888/?token=7f1f8d7d9414a8b72j2e2cc2c2866c29fb557677e9a08042>

JupyterCollection is a meta-module,  
which loads the modules:

- JupyterKernel-Bash/0.7.1-2019a.2.4
- JupyterKernel-Cling/0.6-2019a.2.4
- JupyterKernel-JavaScript/5.2.0-2019a.2.4
- JupyterKernel-Julia/1.3.1-2019a.2.4
- JupyterKernel-Octave/5.1.0-2019a.2.4
- JupyterKernel-PyParaView/5.8.0-2019a.2.4
- JupyterKernel-PyQuantum/1.0-2019a.2.4
- JupyterKernel-R/3.5.3-2019a.2.4
- JupyterKernel-Ruby/2.6.3-2019a.2.4
- Jupyter/2019a.2.4-Python-3.6.8

# JUPYTER – START & TUNNEL

## Start your JupyterLab (the hard way)

```
[I 20:44:05.916 NotebookApp] Writing notebook server cookie secret to  
/run/user/12885/jupyter/notebook_cookie_secret
```

[...]

Copy/paste this URL into your browser when you connect for the first time, to login with a token:

<http://localhost:8888/?token=7f1f8d7d9414a8b72j2e2cc2c2866c29fb557677e9a08042>

### Tunnel Jupyter port to workstation

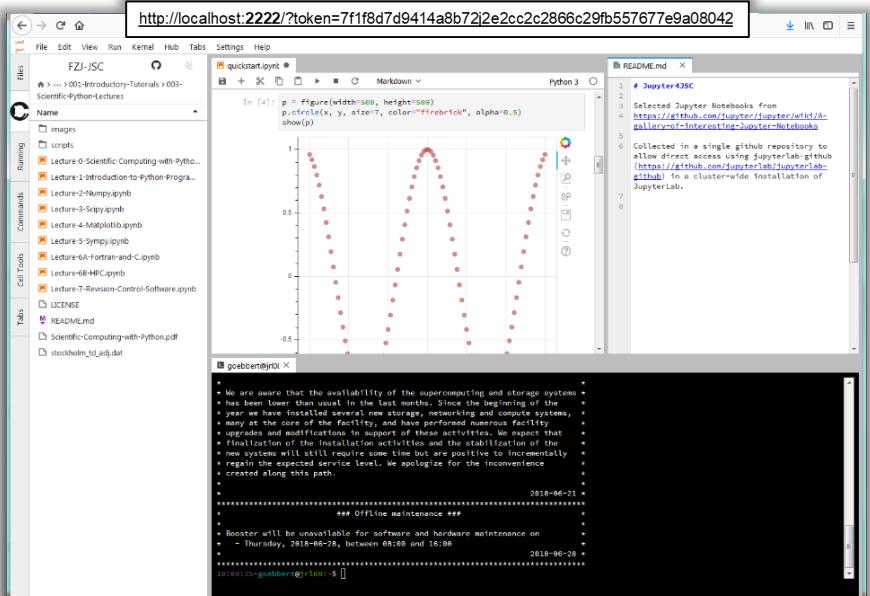

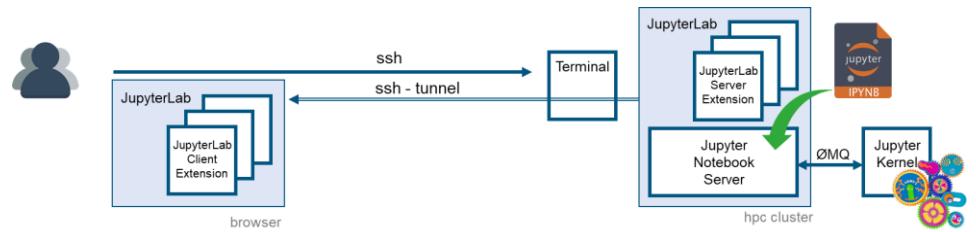

```
Wrkst:> ssh -N -L 2222:localhost:<jupyter-port> \  
<username>@juwels<no>.fz-juelich.de
```

### Open Jupyter in the local browser

Wrkst-Browser:>

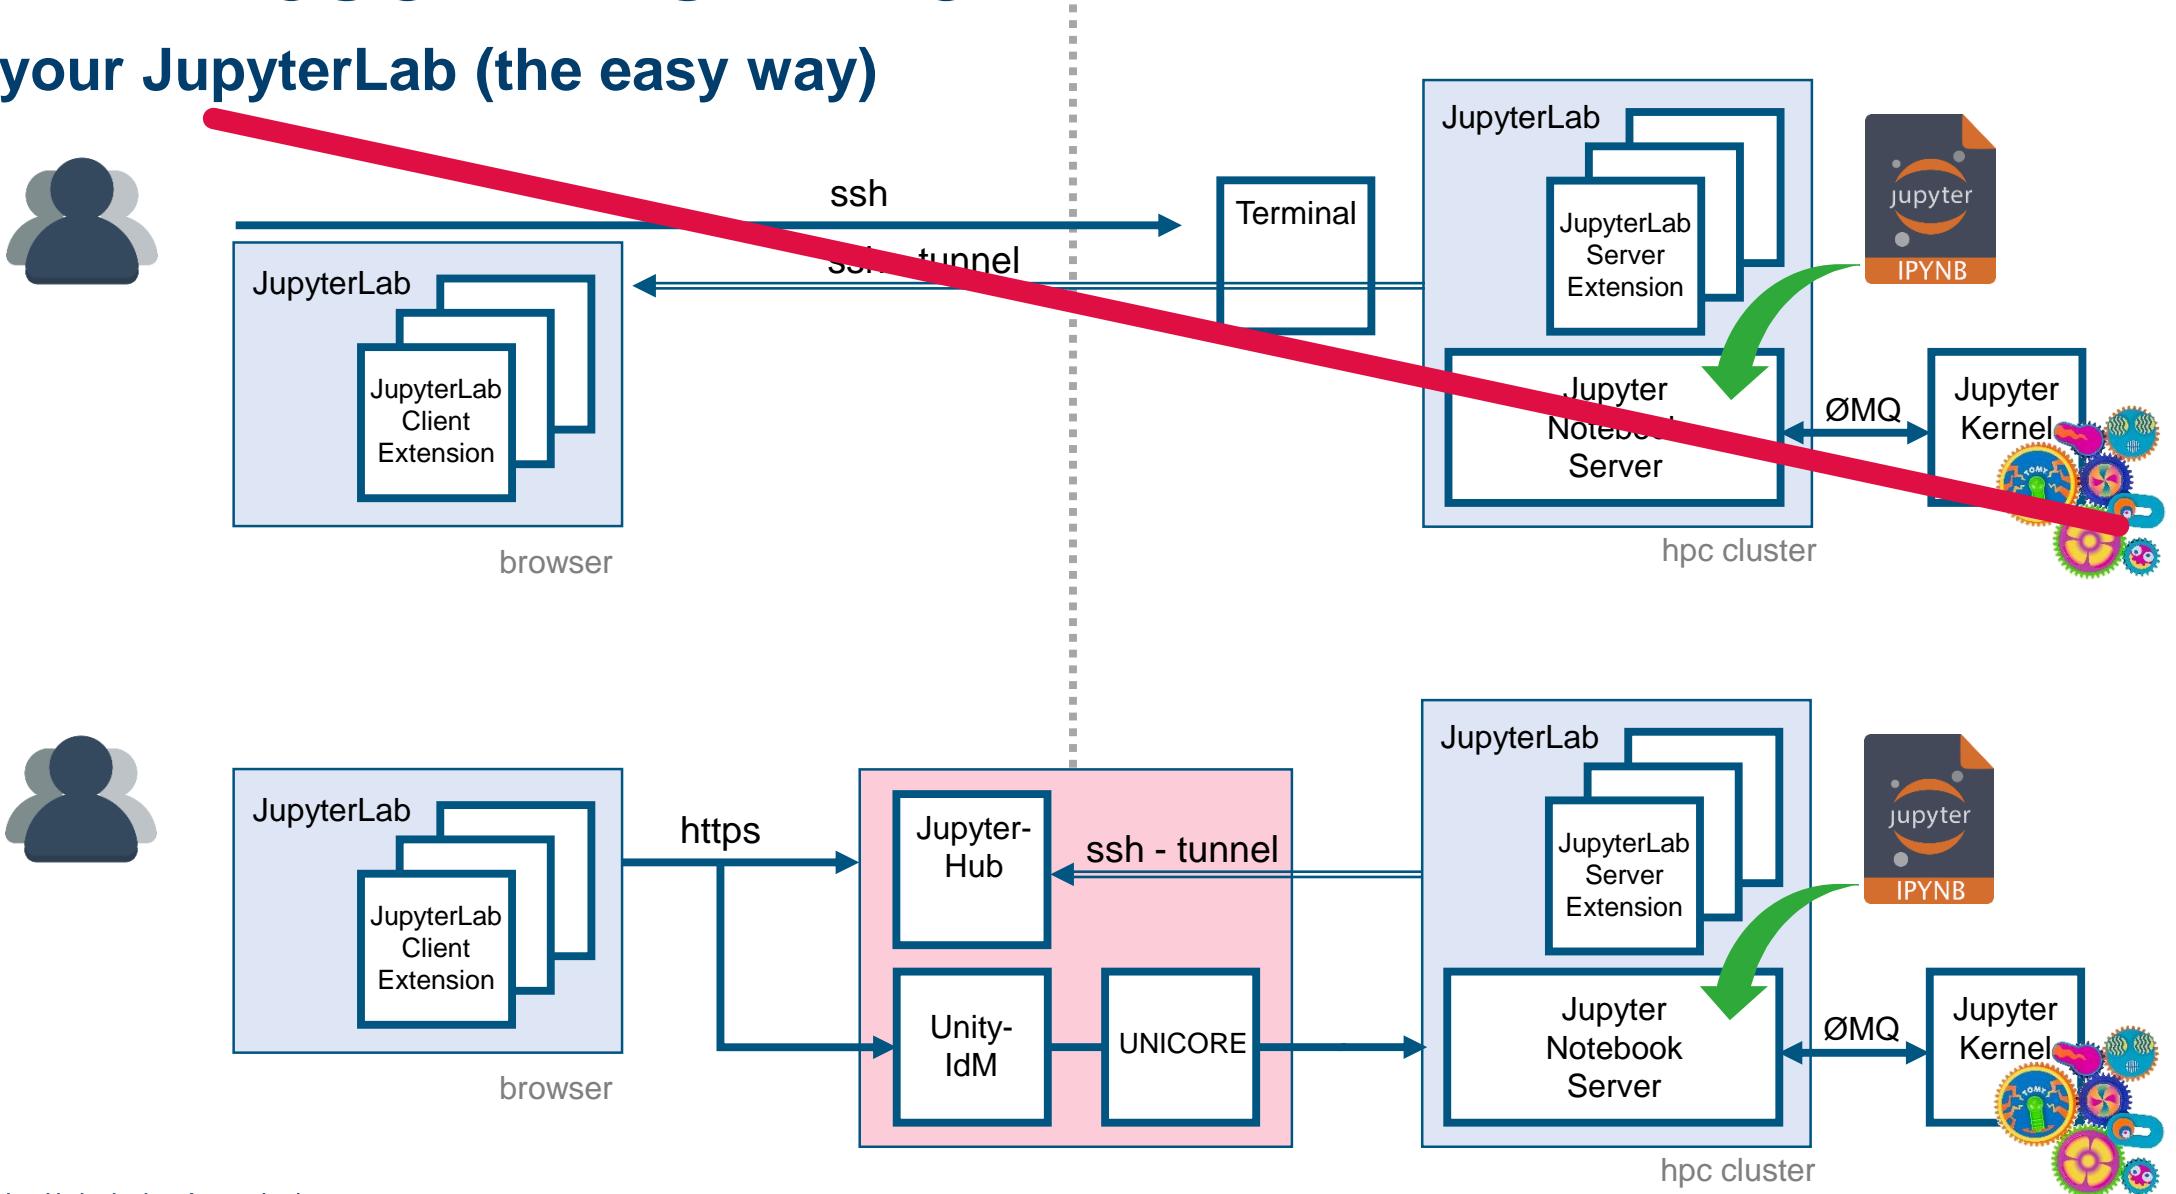

<http://localhost:2222/?token=7f1f8d7d9414a8b72j2e2cc2c2866c29fb557677e9a08042>

- You will see the view on the filesystem **from working directory** of the jupyter command.
- You can only enter sub-directories – you **CANNOT** enter any directory above.  
Please add **softlinks** to directories like \$PROJECT, \$SCRATCH, etc.

# JUPYTER-JSC WEBSERVICE

Start your JupyterLab (the easy way)

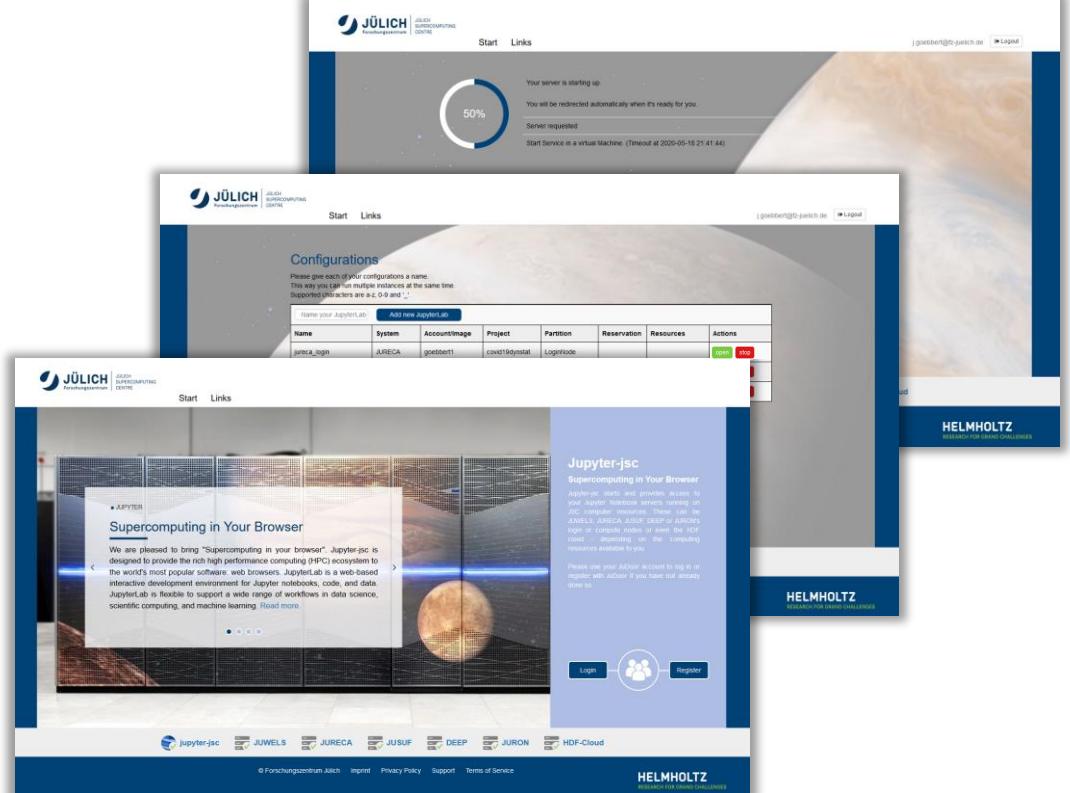

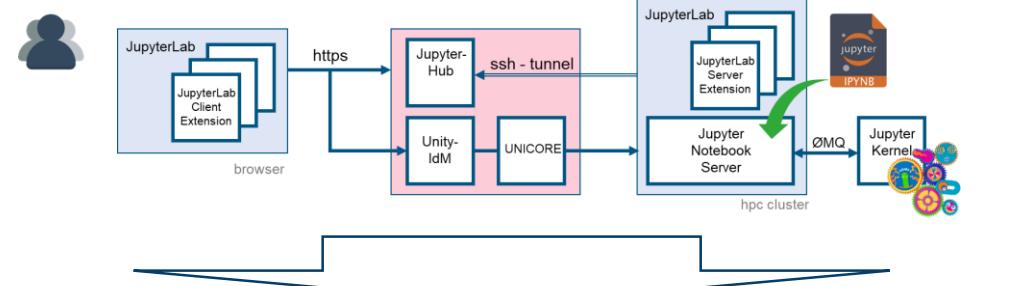

# JUPYTER-JSC WEBSERVICE

## Start your JupyterLab (the easy way)

### JupyterHub

is used to make Jupyter available to a group of HPC users.

- Creates/manages JupyterLabs for single users.
- Connects JupyterLabs to users via a configurable HTTP proxy.
  
- Supports custom spawners
  - UNICORE at JSC
- Supports custom authenticators
  - Unity-IdM at JSC

# JUPYTER-JSC WEBSERVICE

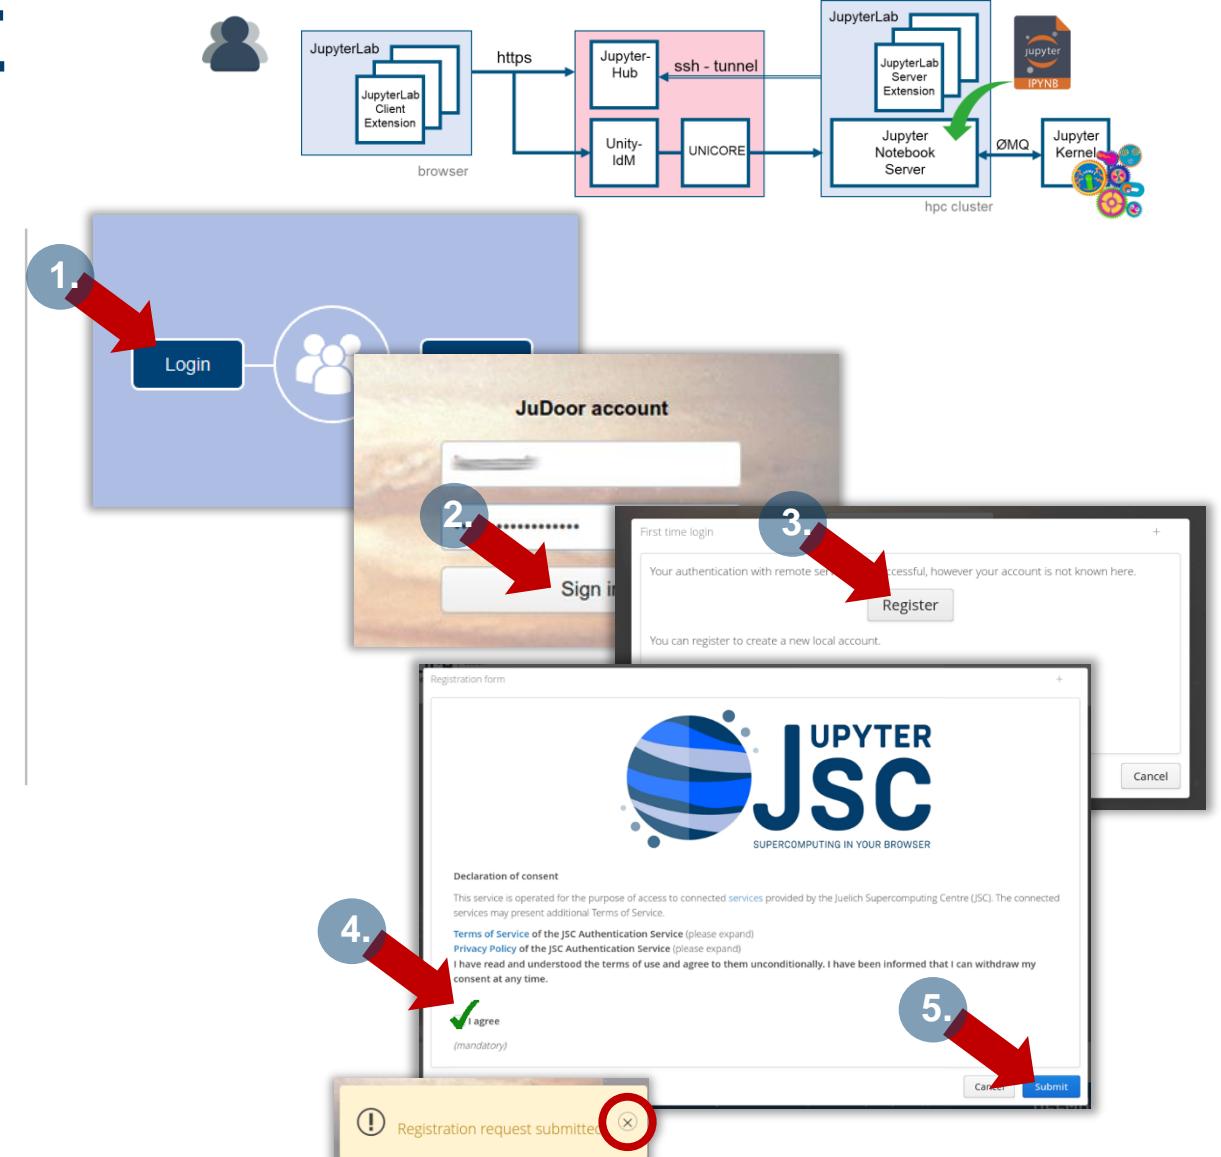

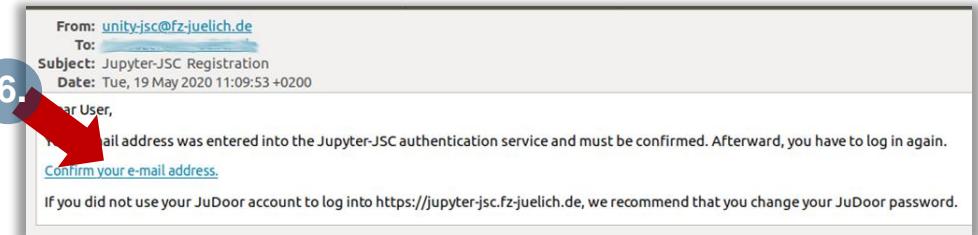

## First time login

=> <https://jupyter-jsc.fz-juelich.de>

### Jupyter-JSC first time login

- Requirements:
  - Registered at [judoor.fz-juelich.de](https://judoor.fz-juelich.de)
    - (with “Connected Services” = jupyter-jsc)

1. Login at [jupyter-jsc.fz-juelich.de](https://jupyter-jsc.fz-juelich.de)
2. Sign in with your JSC account
3. Register to Jupyter-JSC
4. **Accept usage agreement**
5. Submit the registration
6. Wait for email and confirm your email address

# JUPYTER-JSC WEBSERVICE

## Control Panel

### A. Jupyter-JSC – Add new JupyterLab

Name your JupyterLab  Add new JupyterLab

- Name your new JupyterLab configuration
  - Unique Jupyter workspace in ~/.jupyter
- => the **JupyterLab Options** page will open

### B. Jupyter-JSC – Actions

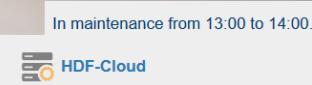

If a configuration has been added

- Start/delete the named configuration  
(workspace will not be deleted)
- Open/stop a **running** JupyterLab

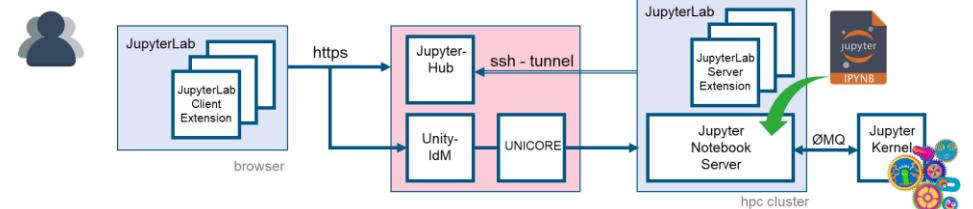

start  delete  
 open  stop

### C. Jupyter-JSC -- Statusbar

- Upcoming maintenance  
(mouse hover for details)  
  
HDF-Cloud
- System offline  

Member of the Helmholtz Association

Name	System	Account/Image	Project	Partition	Reservation	Resource	Actions
jureca_login	JURECA	goebbert1	covid19dynstat	LoginNode			<input type="button"/> start <input type="button"/> delete
jusuf_login	JUSUF	goebbert1	cjsc	LoginNode			<input type="button"/> open <input type="button"/> stop
juwels_login	JUWELS	goebbert1	ccstvs	LoginNode			<input type="button"/> start <input type="button"/> delete

### B. Jupyter-JSC – Logout

Logout will ask what you want to do with the running JupyterLabs – be careful what you answer!

# JUPYTER-JSC WEBSERVICE

## JupyterLab Options

### Jupyter-JSC – Options

Available options **depend on**

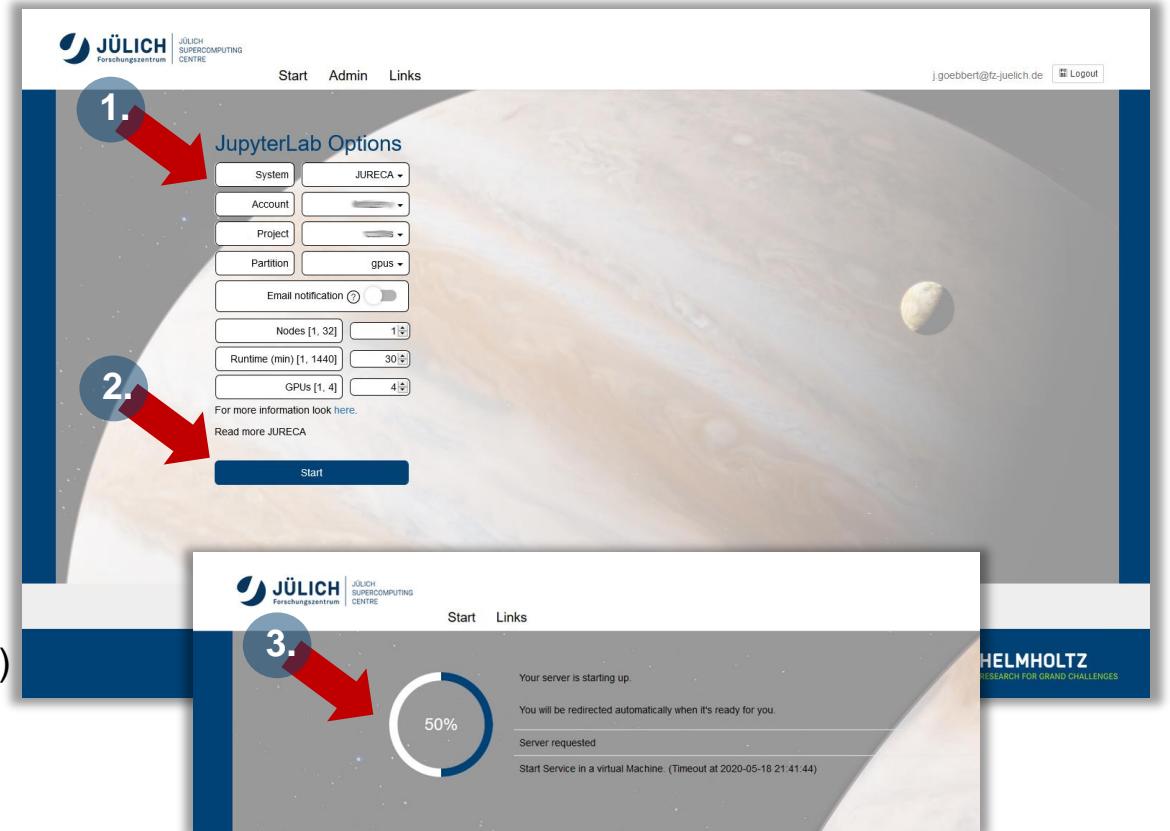

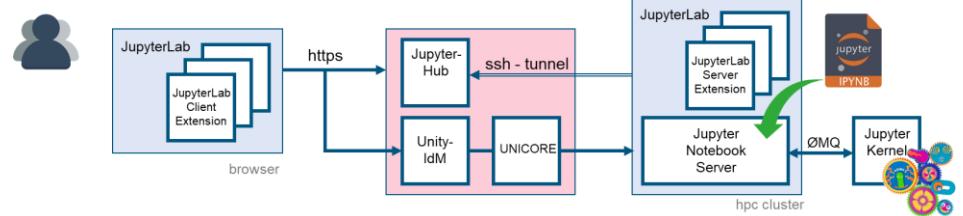

- user account settings visible in [judoor.fz-juelich.de](https://judoor.fz-juelich.de)
- currently available systems in all of your projects
  - system specific usage agreement on JuDoor is signed

### Basic options

- System:  
JUWELS, JURECA, JUSUF, DEEP, HDFML, HDF-Cloud
- Account:  
In general users only have a single account
- Project:  
project which have access to the selected system
- Partition:  
partition which are accessible by the project  
(this includes the decision for LoginNode and ComputeNode)
- Email notification:  
Send an email when the JupyterLab has started  
(useful if the JupyterLab starts on a compute node)

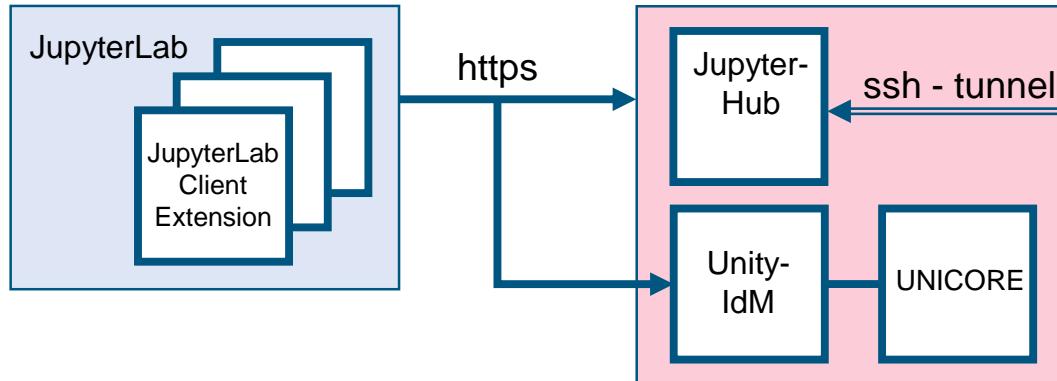

### Extra options

- Partition == compute      Nodes, Runtime, GPUs, ...
- System == HDF-Cloud      Image

# JUPYTER-JSC WEBSERVICE

## System: HDF-Cloud

### Helmholtz Data Federation (HDF)-Cloud

Any user having

- a JSC account ([judoor.fz-juelich.de](https://judoor.fz-juelich.de))
  - the Connected Service “jupyter-jsc” enabled (default for HPC accounts)
- can start
- Jupyter-JSC container images (containing JupyterLab) on the HDF-Cloud
    - “**base-notebook**” – close to the installation on the clusters
    - The Core Images of the Jupyter Docker Stacks
      - <https://jupyter-docker-stacks.readthedocs.io>
      - <https://github.com/jupyter/docker-stacks>

HDF-Cloud – OpenStack Cluster for running Virtual Machines

user storage  
(local to Jupyter-JSC on HDF-Cloud)

more Jupyter-JSC container

⋮

more Virtual Machines

# JUPYTER-JSC WEBSERVICE

## System: HDF-Cloud

### Start JupyterLab on HDF-Cloud

- Requirements:
  - Registered JSC account at judoor.fz-juelich.de
  - Logged in to Jupyter-JSC at jupyter-jsc.fz-juelich.de
  - Named a new JupyterLab configuration
- Start a JupyterLab:
  - System == “HDF-Cloud”
  - Select Image == “base-notebook”
  - Click “Start”
  - Wait for JupyterLab to be started

JupyterLab is running in a container on the HDF-Cloud

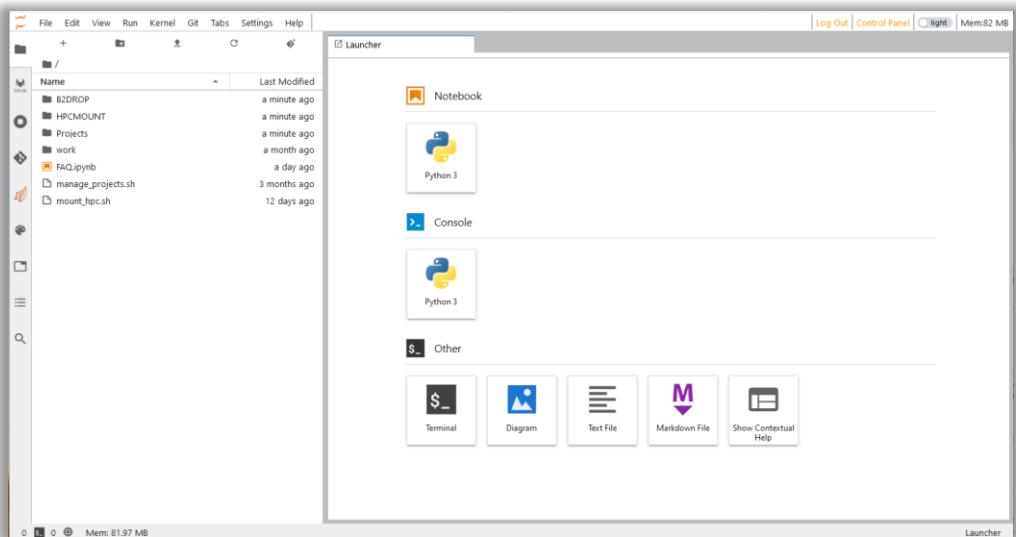

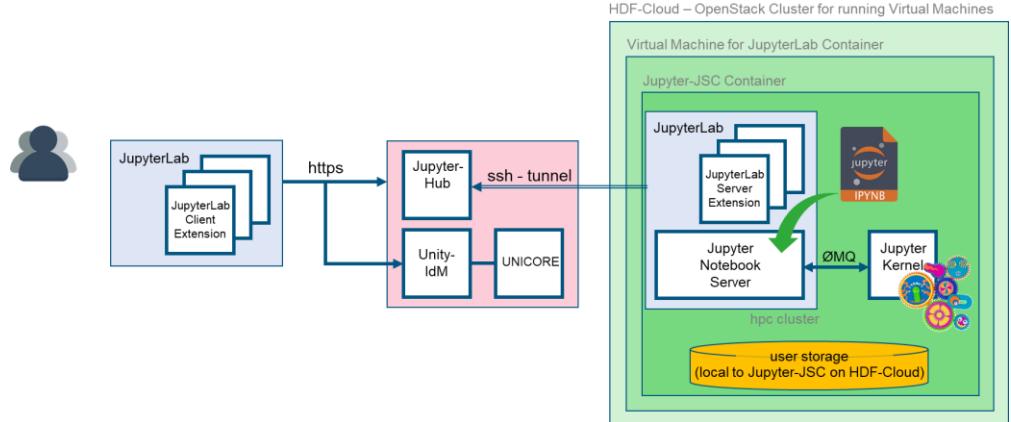

# JUPYTER-JSC WEBSERVICE

## System: HDF-Cloud

### Limitations on JupyterLab on HDF-Cloud

- max. **2 GB** memory
- Installed Jupyter Kernel limited
- Storage in Jupyter-JSC container
  - **is local** to the HDF-Cloud
  - only accessible from a Jupyter-JSC container
  - stored persistently in a personal data container if in
    - `~/work` (max. 10 GB)
    - `~/Projects` (max. 10 GB)
  - backup of `~/work` and `~/Projects` every day to tape
- Depending on the load of the OpenStack you might be limited in the **number of** simultaneous running JupyterLab containers
- HDF-Cloud has at the moment **no GPUs**

# JUPYTER-JSC WEBSERVICE

## System: HDF-Cloud

How can I share/backup my work from JupyterLab?

1. Download the file

2. ~ / Projects

for sharing data between JupyterLab-users on HDF-Cloud

3. Mount your HPC cluster directory with sshfs

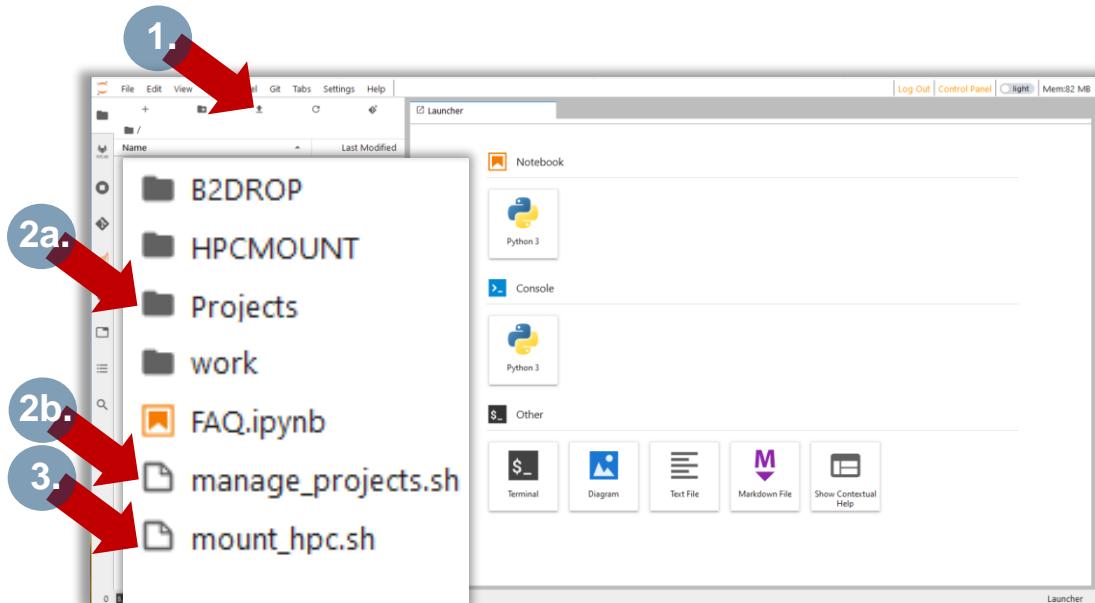

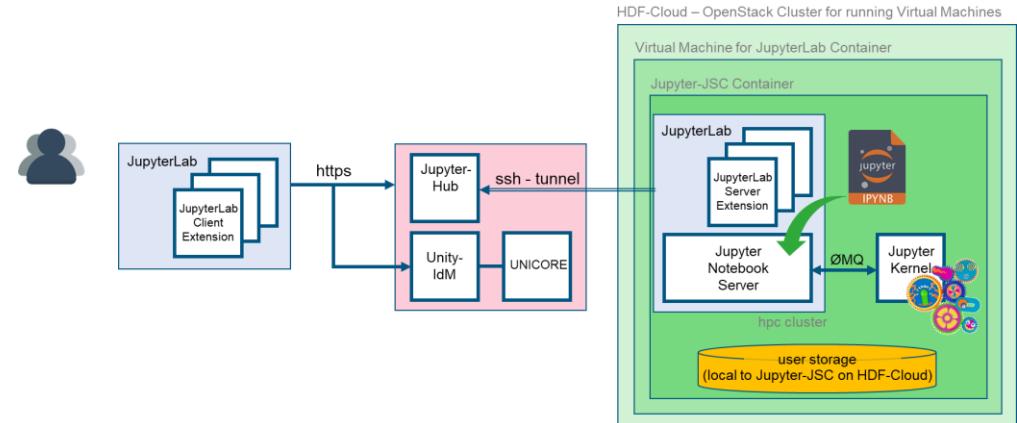

- B2Drop – <https://b2drop.eudat.eu>
- Git / GitHub / GitLab

**NEVER forget:**

- Data is **ONLY** persistent in ~ / Projects and ~ / work

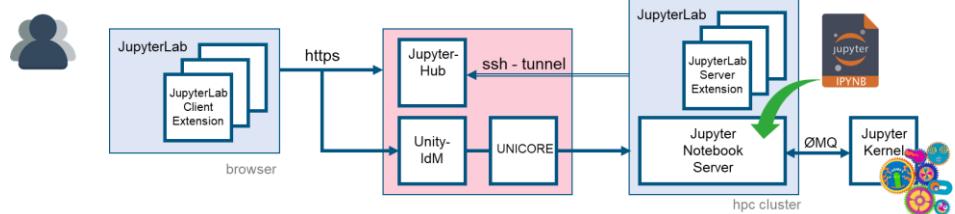

For more details please visit:

[https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j\\_notebooks/-/blob/master/FAQ\\_HDFCloud.ipynb](https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j_notebooks/-/blob/master/FAQ_HDFCloud.ipynb)

# JUPYTER-JSC WEBSERVICE

## Some comments about the UI

This screenshot shows the JupyterLab interface with several annotations:

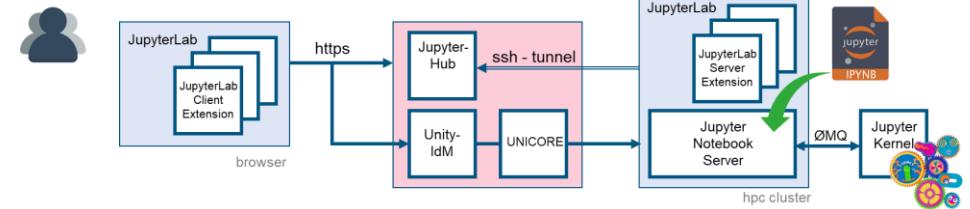

- open filebrowser**: Points to the sidebar icon.
- tutorials & examples**: Points to the sidebar section.
- open launcher**: Points to the launcher icon.
- sidebar with core and extenstions features**: Points to the left sidebar.
- indicates active notebook cell**: Points to the cell status bar.
- type of active notebook cell**: Points to the cell identifier in the code editor.
- logout & close all running JupyterLabs**: Points to the Log Out and Control Panel buttons.
- no close, but go back to Jupyter-JSC's controll panel**: Points to the Control Panel button.
- memory consuption (keep an eye on that!)**: Points to the memory usage indicator.
- Type of Jupyter kernel this notebook is connected to (click to change)**: Points to the kernel selection dropdown.
- notebook cell**: Points to the cell status bar.
- [\*] indicates that cell was send to Jupyter kernel for execution**: Points to the cell identifier in the code editor.
- JupyterLab LaTeX Extension**: Points to the LaTeX extension documentation.
- JupyterLab LMod**: Points to the LMod extension documentation.
- [ ] indicates that cell has never been executed by the connected Jupyter kernel**: Points to the cell identifier in the code editor.

# JUPYTER-JSC SECRETS

## Very important to know

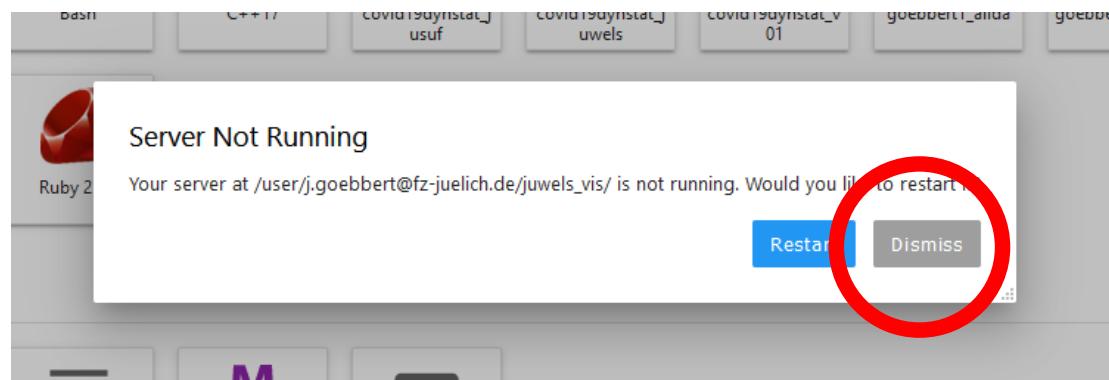

### Secret 1: Support button

- Let us know, if something does not work.  
We can only fix it, if we know it.

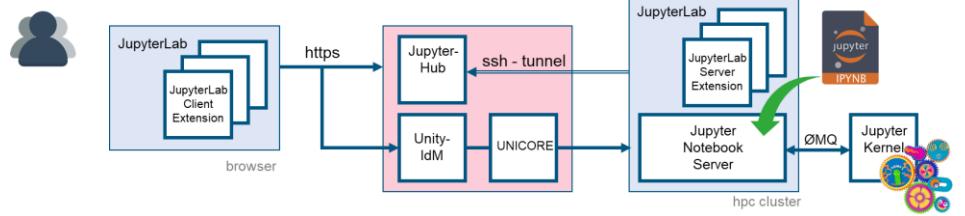

### Secret 2: Reload on connection loss

- “Server Not Running” means, that your browser just lost connection => **Just hit “Dismiss” !!!**
- You can safely hit the “Reload” button of your browser, if the connection to JupyterLab ever gets lost.  
(but that takes more time)

# JUPYTER-JSC SECRETS

For experts only 😊

## Secret 3: Jupyter-JSC logs

- Jupyter-Lab gets started by UNICORE on our HPC systems
- On startup UNICORE created the directory `$SCRATCH_<project>/unicore-jobs/<random-hash>/`
  - In the terminal of a running JupyterLab, this directory is `$JUPYTER_LOG_DIR`
- In this directory you find
  - `stdout` -> terminal output of jupyterlab messages
  - `stderr` -> terminal output of jupyterlab error messages
  - `.start` -> details how your JupyterLab got started

## Secret 4: change to a different JupyterLab version

- In `.start` you can see, that
  - `$HOME/.jupyter/start_jupyter-jsc.sh` is used to load JupyterLab if available.

Here you can switch to an older/newer/other version of JupyterLab, if the new one gives you trouble

```
#!/bin/bash  
  
module purge  
module use $OTHERSTAGES  
module load Stages/Devel-2019a  
module load GCC/8.3.0  
module load JupyterCollection/2019a.2.3
```

Switch to a different JupyterLab with  
`$HOME/.jupyter/start_jupyter-jsc.sh`

# JUPYTERLAB EXTENSIONS

# JUPYTER EXTENSIONS

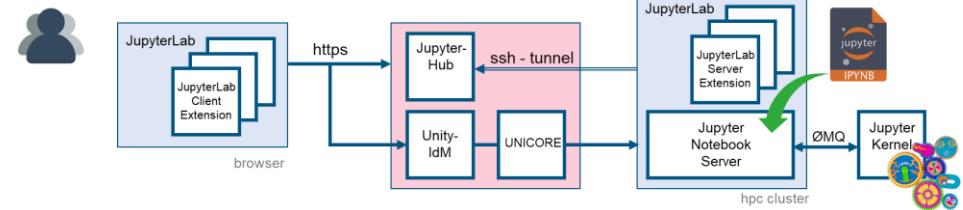

## Some general information

### List the installed JupyterLab extensions

- Open the Launcher
- Start a Terminal
- Run command `jupyter labextension list`

Extensions are installed in  
JupyterLab's Application Directory, which

- stores any information that JupyterLab persists
  - including settings and built assets of extensions
- default location is `<sys-prefix>/share/jupyter/lab`
- can be relocated by setting `$JUPYTERLAB_DIR`
- is immutable
  - **any change requires a rebuild** of the whole JupyterLab to take effect!
  - contains the JupyterLab static assets
    - (e.g. `static/index.html`)

A screenshot of a terminal window titled "Terminal 3" showing the output of the command `jupyter labextension list`. The output lists various extensions installed in the JupyterLab application directory, all marked as "enabled OK".

```
jupyter@dad3db89c836:~$ jupyter labextension list
JupyterLab v1.2.1
Known labextensions:
  app dir: /opt/conda/share/jupyter/lab
    @bokeh/jupyter_bokeh v1.1.1 enabled OK
    @jupyter-voila/jupyterlab-voila v0.1.3 enabled OK
    @jupyter-widgets/jupyterlab-manager v1.0.3 enabled OK
    @jupyter-widgets/jupyterlab-sidecar v0.4.0 enabled OK
    @jupyterlab/celltags v0.2.0 enabled OK
    @jupyterlab/out v0.8.2 enabled OK
itkwidgets v0.22.0 enabled OK
jsfileupload v0.1.0 enabled OK
jupyter-leaflet v0.11.4 enabled OK
jupyter-matplotlib v0.4.2 enabled OK
jupyter-mathjax v0.1.0 enabled OK
jupyter-vue v1.0.0 enabled OK
jupyter-vueify v1.1.0 enabled OK
jupyter-webtrellis v0.5.0 enabled OK
jupyter-webterm v1.0.1 enabled OK
jupyterlab-datasources v1.2.0 enabled OK
jupyterlab-drawio v0.6.0 enabled OK
jupyterlab-gitlab v0.3.0 enabled OK
jupyterlab-logout v0.4.0 enabled OK
jupyterlab-plots v1.2.0 enabled OK
jupyterlab-previewsync v0.4.1 enabled OK
jupyterlab-theme-toggle v0.4.2 enabled OK
jupyterlab-topbar-extension v0.4.0 enabled OK
jupyterlab_iframe v0.2.1 enabled OK
nodejs-jupyterlab v1.0.0 enabled OK
plotlywidget v0.2.0 enabled OK
pylink v0.1.2 enabled OK
jupyter@dad3db89c836:~$
```

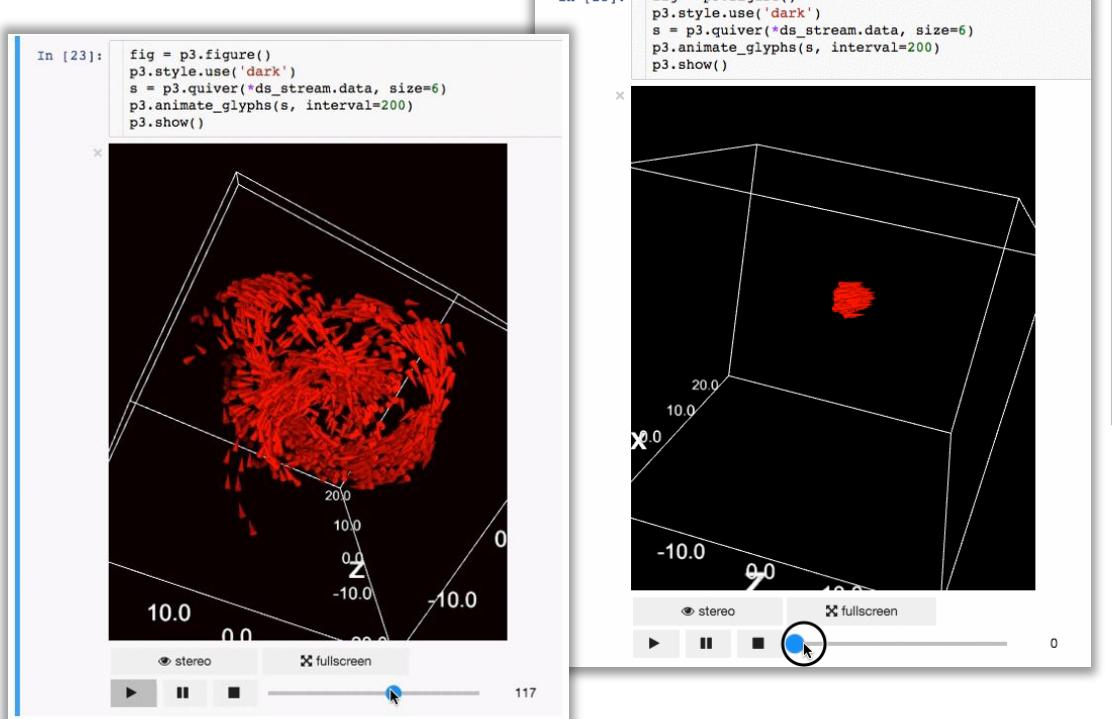

<https://jupyterlab.readthedocs.io/en/stable/user/extensions.html>

# JUPYTER-JSC EXTENSIONS

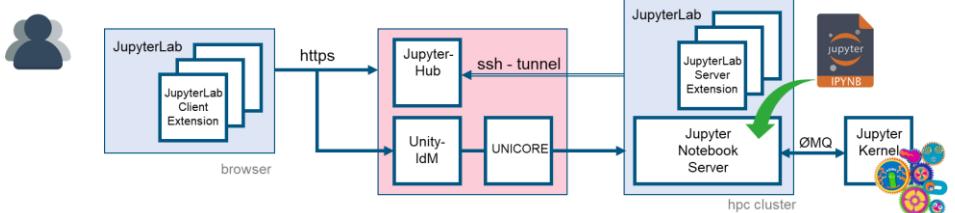

## Installed by default

### IPyVolume

3d plotting for Python in the Jupyter notebook based on IPython widgets using WebGL

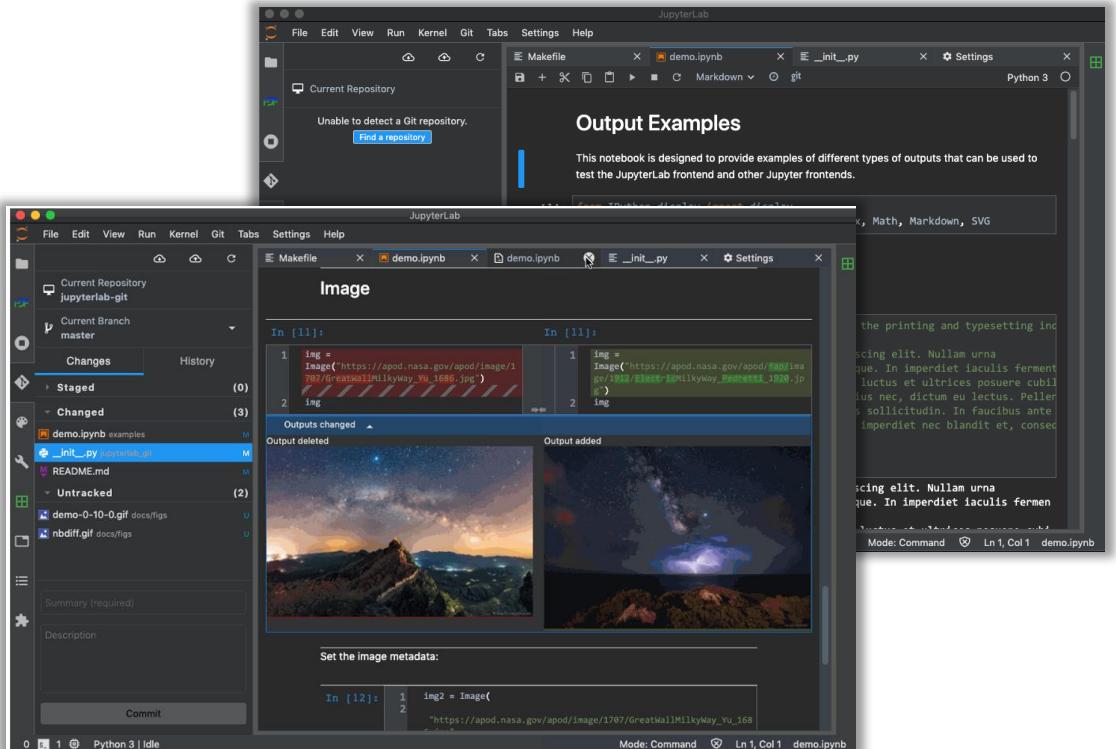

<https://github.com/maartenbreddels/ipyvolume>

### JupyterLab-Git

JupyterLab extension for version control using Git

<https://github.com/jupyterlab/jupyterlab-git>

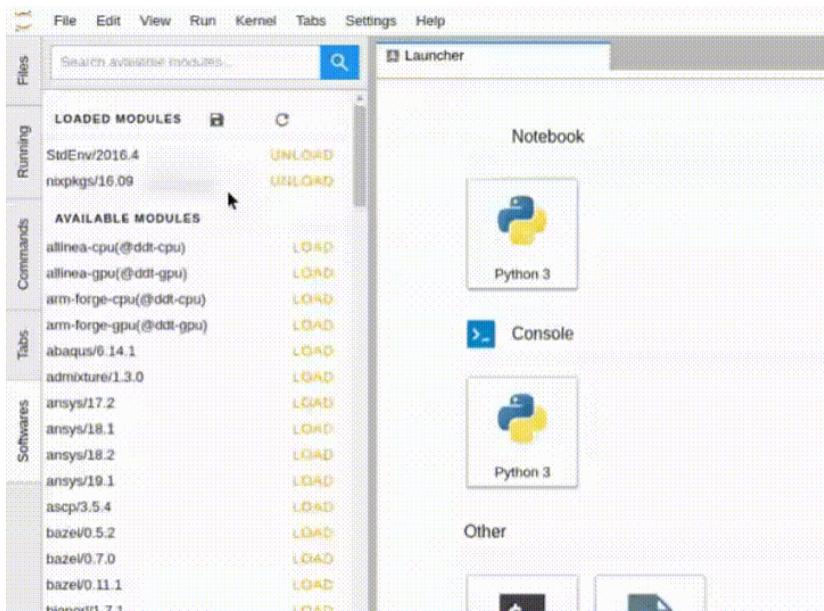

# JUPYTER-JSC EXTENSIONS

## Installed by default

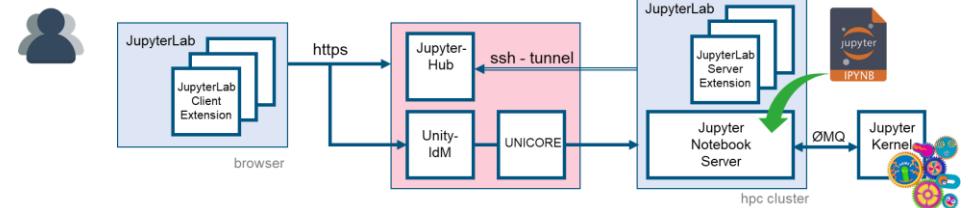

### JupyterLab-Lmod

JupyterLab extension that allows user to interact with environment modules before launching kernels.

- **Remember** to restart the kernel after loading other modules.

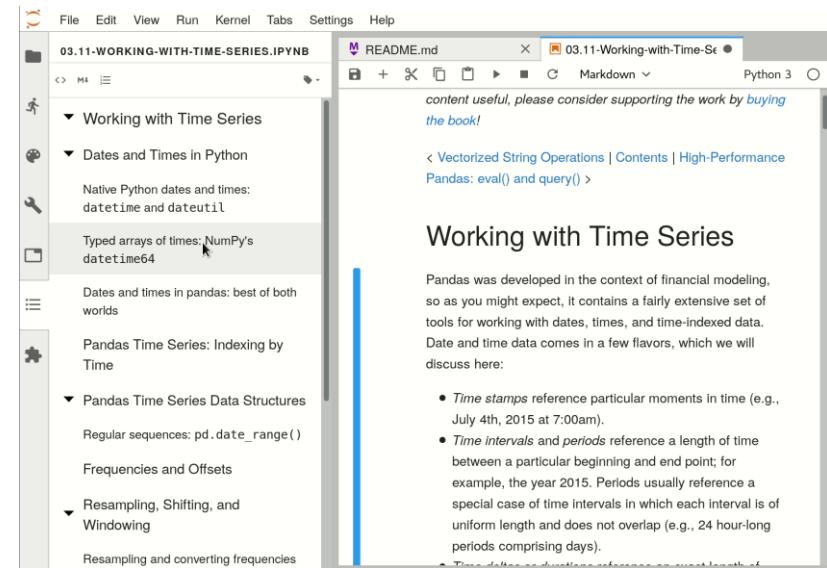

<https://github.com/cmd-ntrf/jupyter-lmod>

### JupyterLab-toC

A Table of Contents extension for JupyterLab. This auto-generates a table of contents in the left area when you have a notebook or markdown document open. The entries are clickable, and scroll the document to the heading in question.

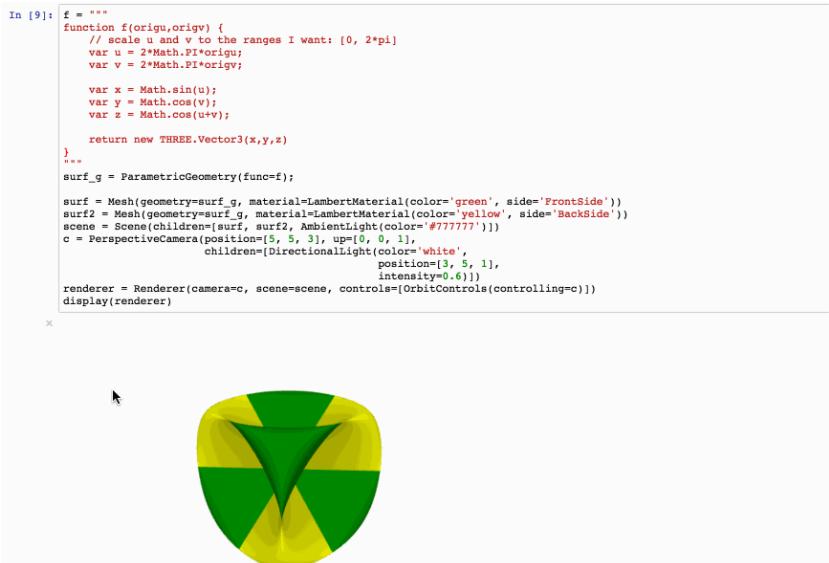

<https://github.com/jupyterlab/jupyterlab-toC>

# JUPYTER-JSC EXTENSIONS

## Installed by default

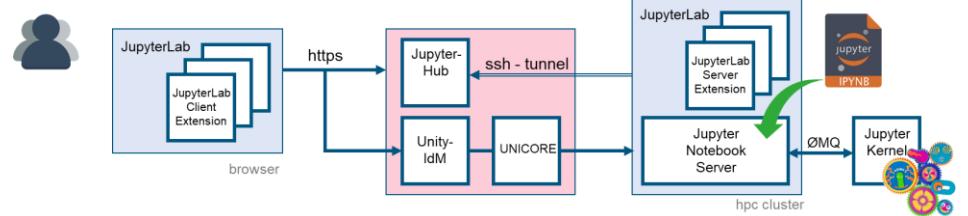

### PyThreeJS

A Python / ThreeJS bridge utilizing the Jupyter widget infrastructure.  
<https://threejs.org> - lightweight, 3D library with a default WebGL renderer.

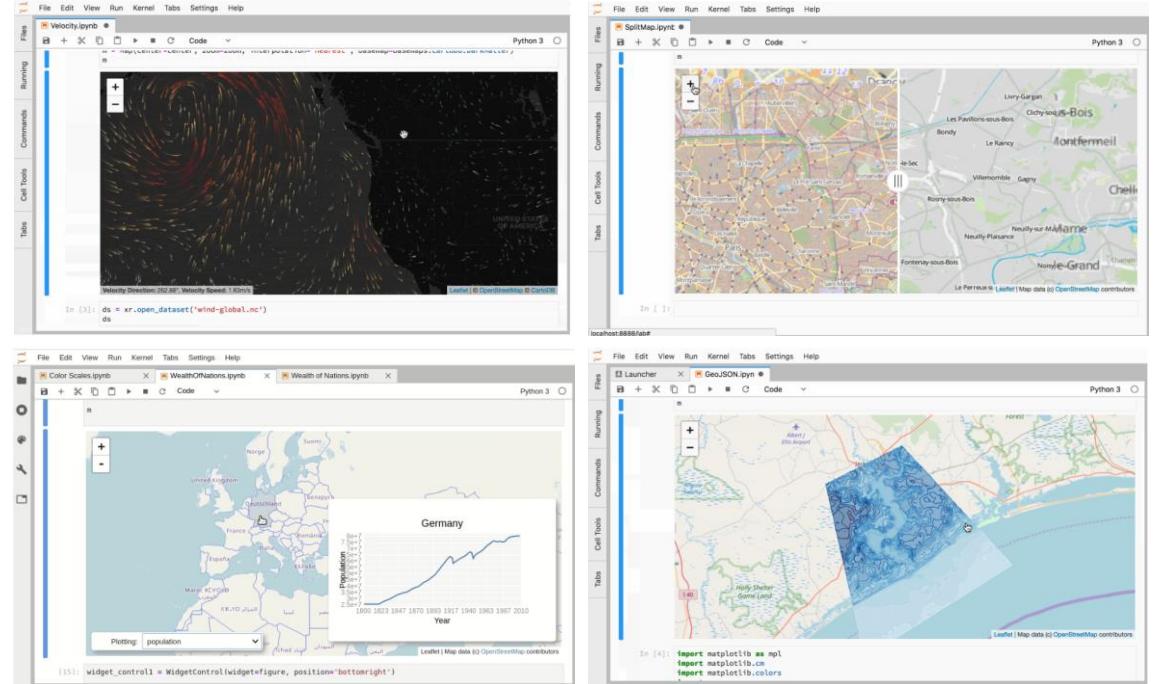

<https://github.com/jupyter-widgets/pythreejs>

Member of the Helmholtz Association

### IPyLeaflet

A Jupyter / Leaflet bridge enabling interactive maps in the Jupyter notebook.

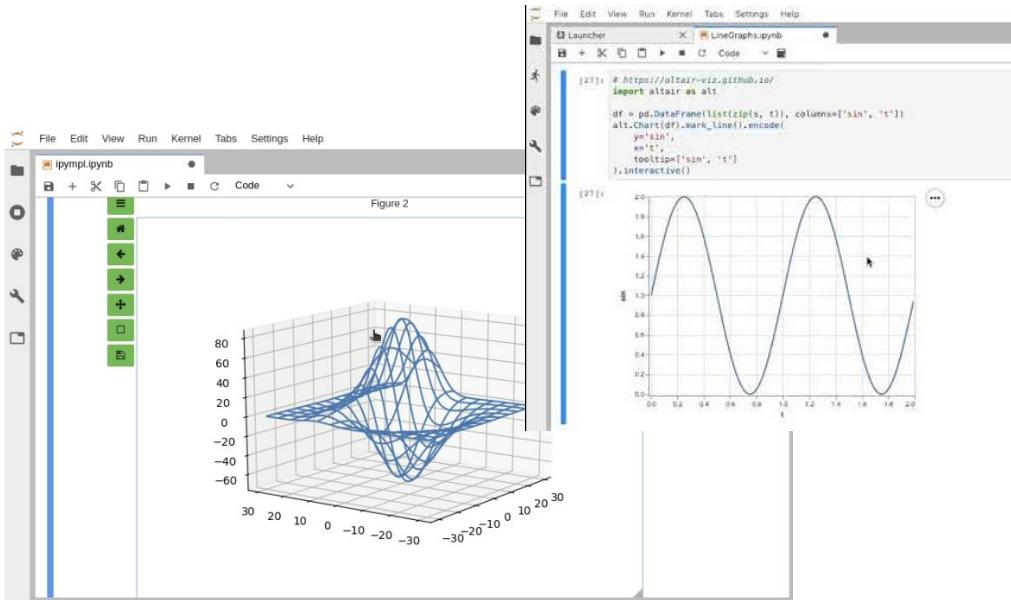

<https://github.com/jupyter-widgets/ipyleaflet>

# JUPYTER-JSC EXTENSIONS

## Installed by default

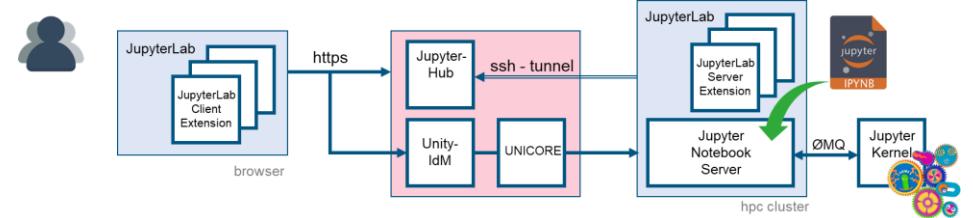

### IPyMPL - matplotlib

Leveraging the Jupyter interactive widgets framework, ipympl enables the interactive features of matplotlib in the Jupyter notebook and in JupyterLab.

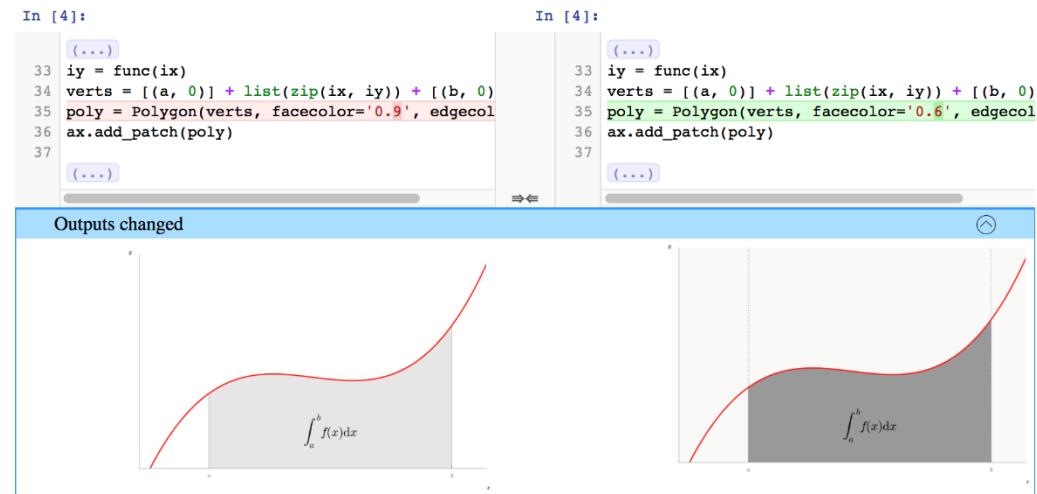

<https://github.com/matplotlib/ipympl>

Member of the Helmholtz Association

### NBDime

Tools for diffing and merging of Jupyter notebooks.

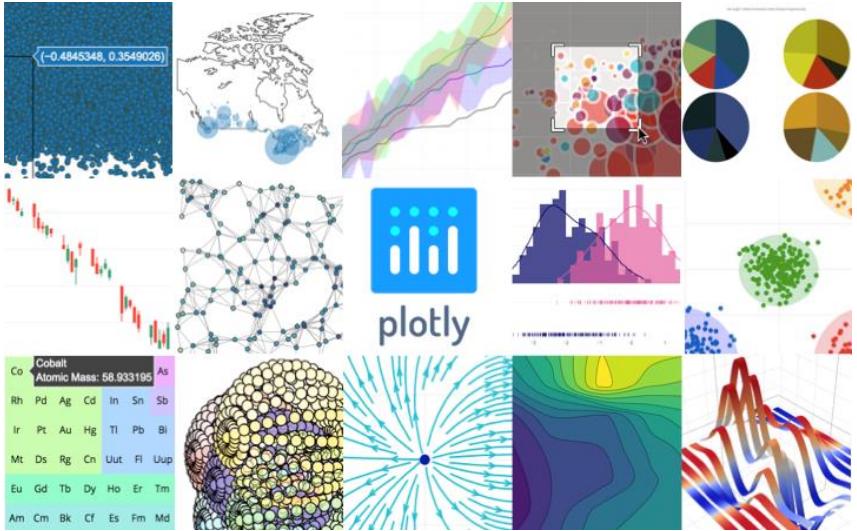

<https://github.com/jupyter/nbdime>

# JUPYTER-JSC EXTENSIONS

## Installed by default

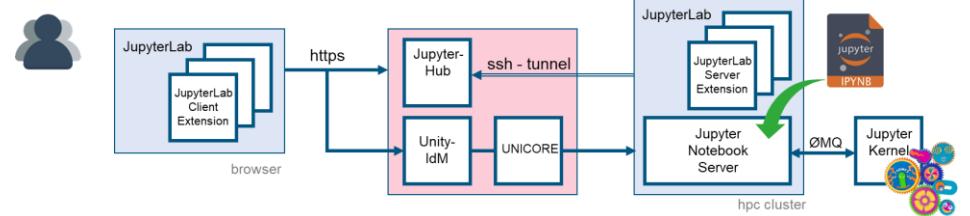

### Plotly

JupyterLab extension for the interactive and browser-based graphing library Plotly.  
<https://plotly.com/python/>

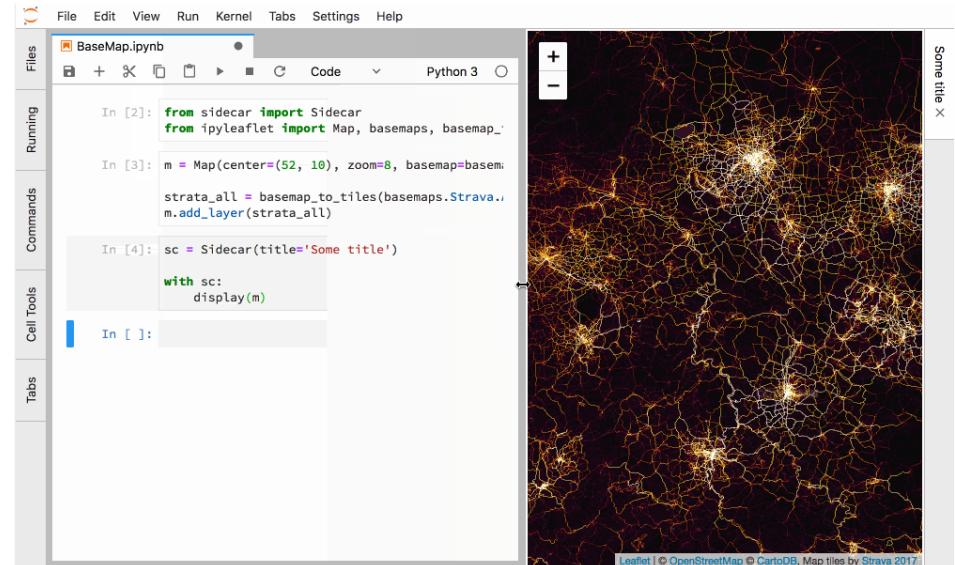

<https://github.com/plotly/plotly.py>

Member of the Helmholtz Association

### JupyterLab-Sidecar

A sidecar output widget for JupyterLab.

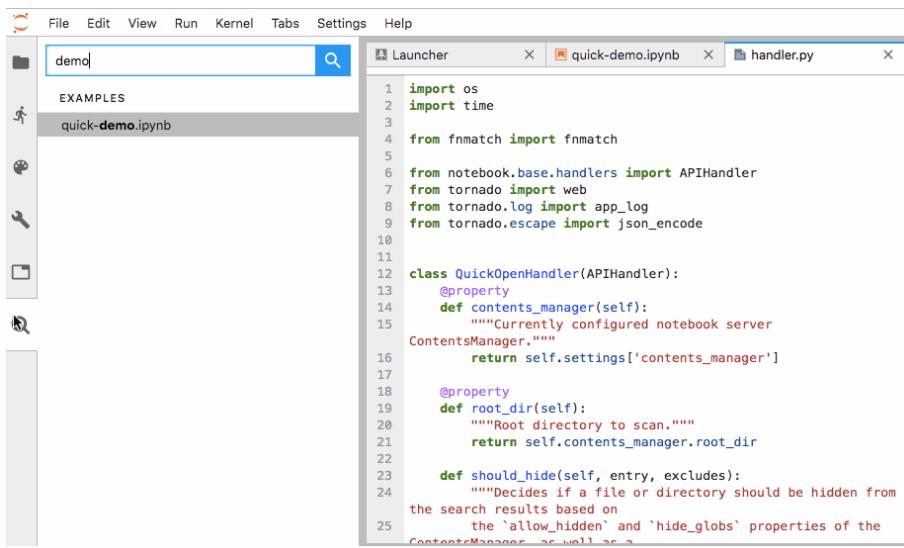

<https://github.com/jupyter-widgets/jupyterlab-sidecar>

# JUPYTER-JSC EXTENSIONS

## Installed by default

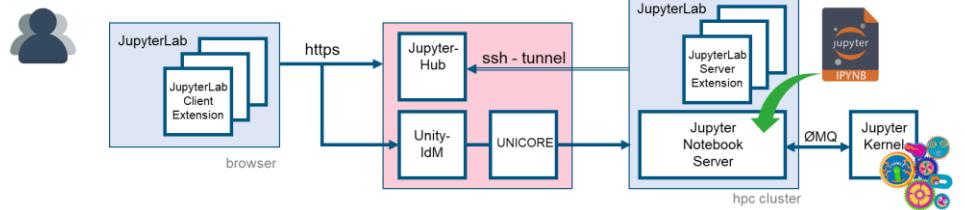

### JupyterLab-Quickopen

Quickly open a file in JupyterLab by typing part of its name

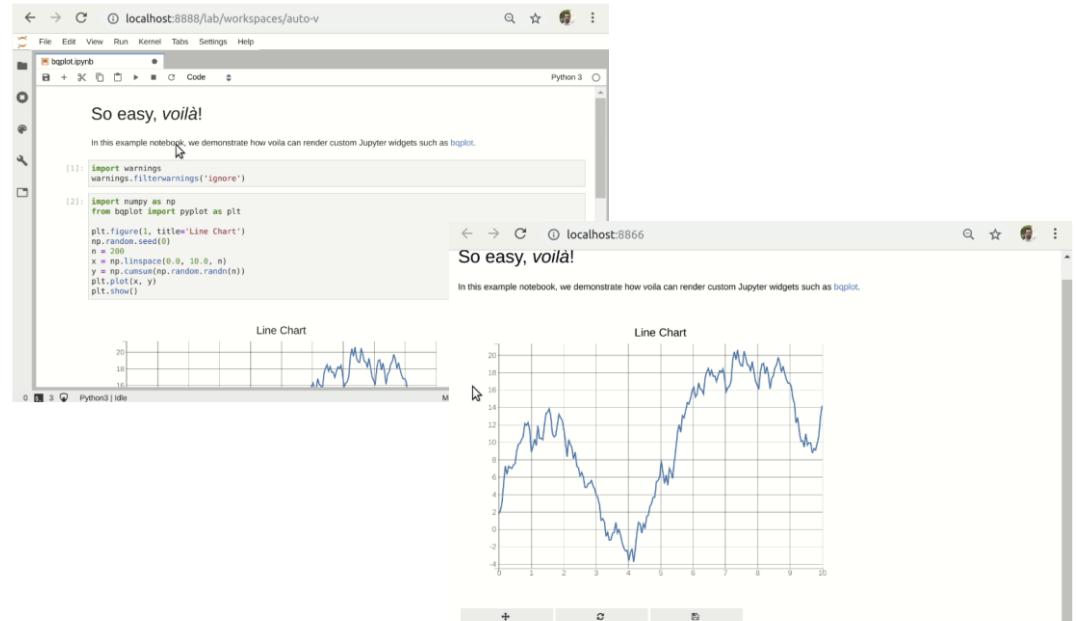

```
File Edit View Run Kernel Tabs Settings Help
Launcher x quick-demo.ipynb x handler.py x
EXAMPLES
quick-demo.ipynb
demo
1 import os
2 import time
3
4 from fnmatch import fnmatch
5
6 from notebook.base.handlers import APIHandler
7 from tornado import web
8 from tornado.log import app_log
9 from tornado.escape import json_encode
10
11
12 class QuickOpenHandler(APIHandler):
13     @property
14     def contents_manager(self):
15         """Currently configured notebook server
16         ContentsManager."""
17         return self.settings['contents_manager']
18
19     @property
20     def root_dir(self):
21         """Root directory to scan."""
22         return self.contents_manager.root_dir
23
24     def should_hide(self, entry, excludes):
25         """Decides if a file or directory should be hidden from
the search results based on
the 'allow_hidden' and 'hide_globs' properties of the
ContentsManager, as well as
```

<https://github.com/parente/jupyterlab-quickopen>

### Voilà

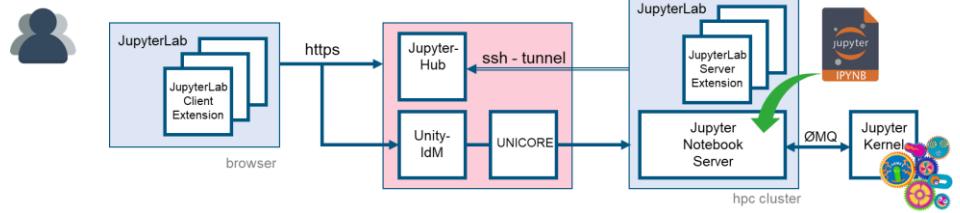

Voilà turns Jupyter notebooks into standalone web applications.

<https://github.com/voila-dashboards/voila>

# JUPYTER KERNEL

# JUPYTER KERNEL

## How to create your own Jupyter Kernel

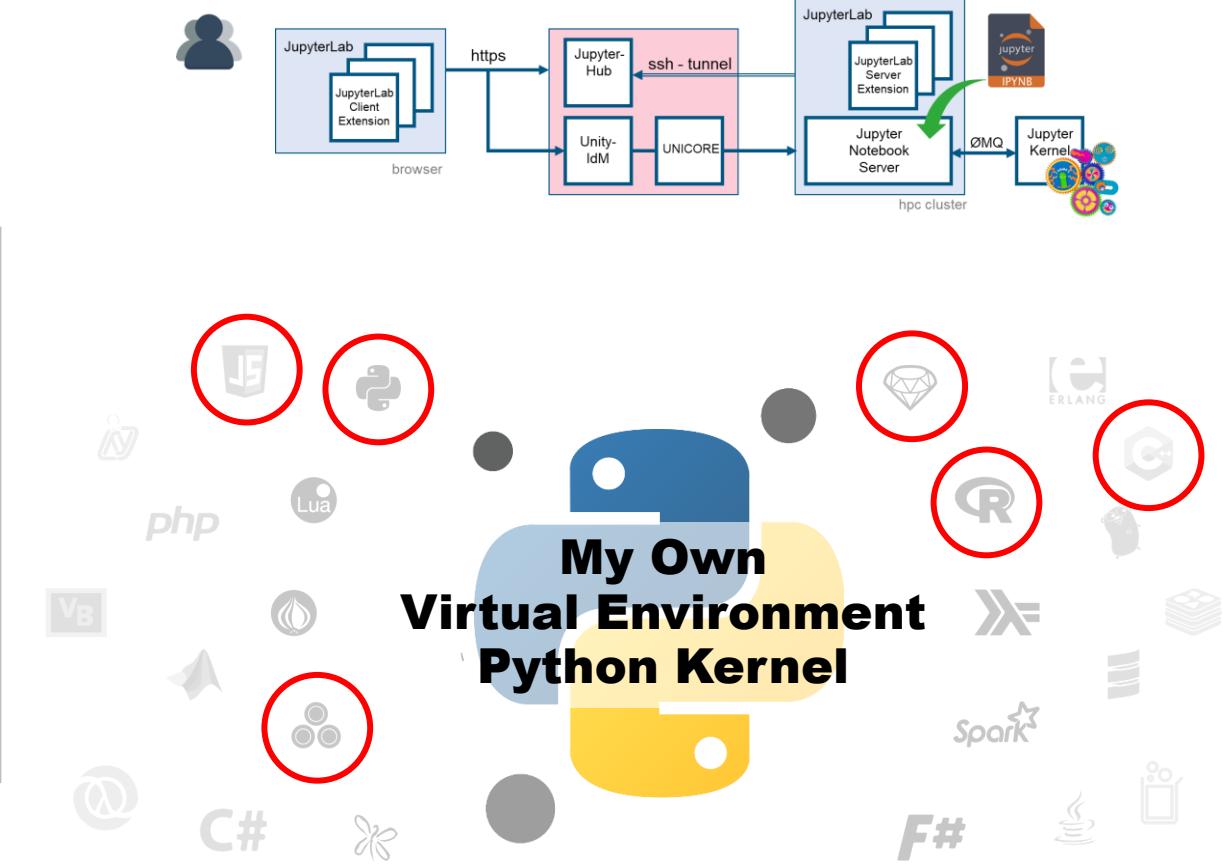

### Jupyter Kernel

A “kernel” refers to the separate process which executes code cells within a Jupyter notebook.

### Jupyter Kernel

- run code in different programming languages **and environments**.
- can be connected to a notebook (one at a time).
- communicates via ZeroMQ with the JupyterLab.
- Multiple **preinstalled** Jupyter Kernels can be found on our clusters
  - Python, R, Julia, Bash, C++, Ruby, JavaScript
  - Specialized kernels for visualization, quantumcomputing

You can easily **create your own kernel** which for example runs your specialized virtual Python environment.

<https://github.com/jupyter/jupyter/wiki/Jupyter-kernels>

# JUPYTER KERNEL

## 1. Create/Pimp new virtual Python environment (1)

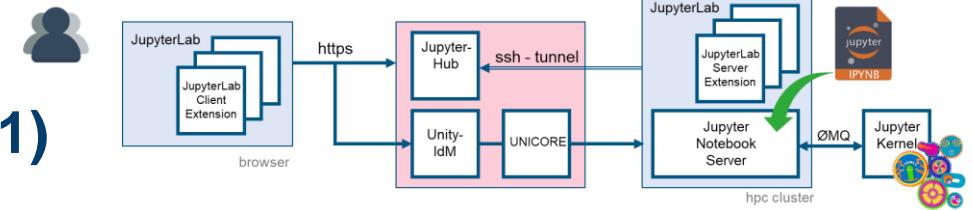

1. Login to JupyterLab and open terminal

2. Load required modules

```
Lnode:> module purge  
Lnode:> module use $OTHERSTAGES  
Lnode:> module load Stages/Devel-2019a  
Lnode:> module load GCC/8.3.0  
Lnode:> module load Jupyter
```

3. Load extra modules you need for your kernel

```
Lnode:> module load <module you need>
```

**Building your own Jupyter kernel  
is a three step process**

- 1.Create/Pimp new virtual Python environment**  
venv
- 2.Create/Edit launch script for the Jupyter kernel**  
kernel.sh
- 3.Create/Edit Jupyter kernel configuration**  
kernel.json

1. Create a virtual environment named <venv\_name> at a path of your choice:

```
Lnode:> python -m venv --system-site-packages <your_path>/<venv_name>
```

2. Activate your environment

```
Lnode:> source <your_path>/<venv_name>/bin/activate
```

[https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j\\_notebooks/-/blob/master/001-Jupyter/Create\\_JupyterKernel\\_general.ipynb](https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j_notebooks/-/blob/master/001-Jupyter/Create_JupyterKernel_general.ipynb)

Member of the Helmholtz Association

# JUPYTER KERNEL

## 1. Create/Pimp new virtual Python environment (2)

1. Ensure python packages installed in the virtual environment are always prefered

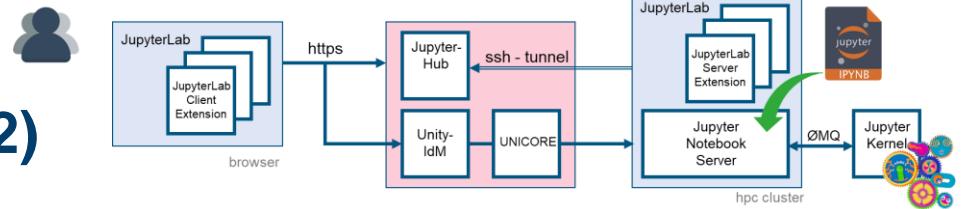

```
(<venv_name>) lnode:> export PYTHONPATH=\${VIRTUAL_ENV}/lib/python3.6/site-packages:\${PYTHONPATH}
```

2. Install Python libraries required for communication with Jupyter

```
(<venv_name>) lnode:>  
    pip install --ignore-installed ipykernel
```

3. Install whatever else you need in your Python virtual environment (using pip)

```
(<venv_name>) lnode:>  
    pip install <python-package you need>
```

**Building your own Jupyter kernel  
is a three step process**

- 1.Create/Pimp new **virtual Python environment**  
venv
- 2.Create/Edit **launch script** for the Jupyter kernel  
kernel.sh
- 3.Create/Edit **Jupyter kernel configuration**  
kernel.json

# JUPYTER KERNEL

## 2. Create/Edit launch script for the Jupyter kernel (1)

1. Create launch script, which loads your Python virtual environment and starts the ipykernel process inside:

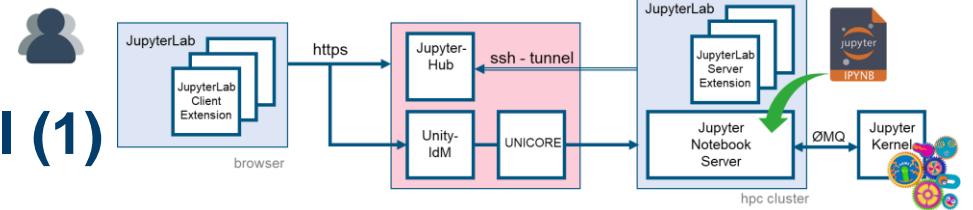

```
(<venv_name>) lnode:> touch ${VIRTUAL_ENV}/kernel.sh
```

2. Make launch script executable

```
(<venv_name>) lnode:> chmod +x ${VIRTUAL_ENV}/kernel.sh
```

3. Edit the launch script for your new Jupyter kernel

```
(<venv_name>) lnode:> vi ${VIRTUAL_ENV}/kernel.sh
```

### Building your own Jupyter kernel is a three step process

1. Create/Pimp new **virtual Python environment**  
venv
2. **Create/Edit launch script for the Jupyter kernel**  
kernel.sh
3. **Create/Edit Jupyter kernel configuration**  
kernel.json

# JUPYTER KERNEL

## 2. Create/Edit launch script for the Jupyter kernel (2)

```
#!/bin/bash

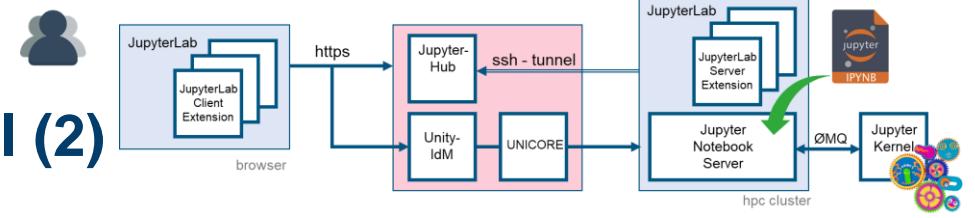

# Load required modules
module purge
module load $OTHERSTAGES
module load Stages/Devel-2019a
module load GCC/8.3.0
module load Jupyter

# Load extra modules you need for your kernel
#module load <module you need>

# Activate your Python virtual environment
source <your_path>/<venv_name>/bin/activate

# Ensure python packages installed in the virtual environment are always preferred
export PYTHONPATH=${VIRTUAL_ENV}/lib/python3.6/site-packages:${PYTHONPATH}

exec python -m ipykernel $@
```

**Building your own Jupyter kernel  
is a three step process**

1. Create/Pimp new **virtual Python environment**  
venv
2. **Create/Edit launch script for the Jupyter kernel**  
kernel.sh
3. **Create/Edit Jupyter kernel configuration**  
kernel.json

[https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j\\_notebooks/-/blob/master/001-Jupyter/Create\\_JupyterKernel\\_general.ipynb](https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j_notebooks/-/blob/master/001-Jupyter/Create_JupyterKernel_general.ipynb)

# JUPYTER KERNEL

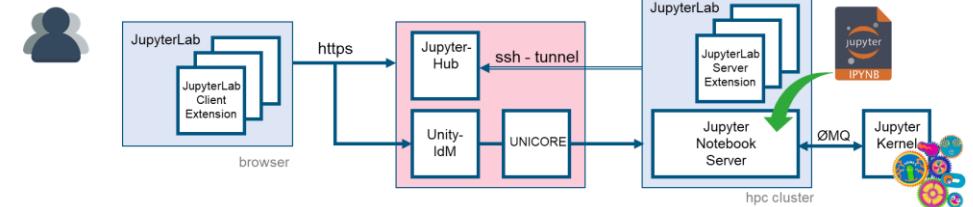

## 3. Create/Edit Jupyter kernel configuration (1)

### 1. Create your Jupyter kernel configuration files

```
(<venv_name>) lnode:>  
python -m ipykernel install --user --name=<my-kernel-name>
```

### 2. Update your kernel file to use the launch script

```
(<venv_name>) lnode:>  
vi ~/.local/share/jupyter/kernels/<my-kernel-name>/kernel.json  
{  
    "argv": [  
        "<your_path>/<venv_name>/kernel.sh",  
        "-m",  
        "ipykernel_launcher",  
        "-f",  
        "{connection_file}"  
    ],  
    "display_name": "<my-kernel-name>",  
    "language": "python"  
}
```

**Building your own Jupyter kernel  
is a three step process**

1. Create/Pimp new **virtual Python environment**  
venv
2. Create/Edit **launch script** for the Jupyter kernel  
kernel.sh
3. Create/Edit **Jupyter kernel configuration**  
kernel.json

# JUPYTER KERNEL

## Run your Jupyter kernel configuration

### Run your Jupyter Kernel

1. <https://jupyter-jsc.fz-juelich.de>
2. Choose system where your Jupyter kernel is installed in `~/.local/share/jupyter/kernels`
3. Select your kernel in the launch pad or click the kernel name.

### Conda

How to base your Jupyter Kernel on a Conda environment:

[https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j\\_notebooks/-/blob/master/001-Jupyter/Create\\_JupyterKernel\\_conda.ipynb](https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j_notebooks/-/blob/master/001-Jupyter/Create_JupyterKernel_conda.ipynb)

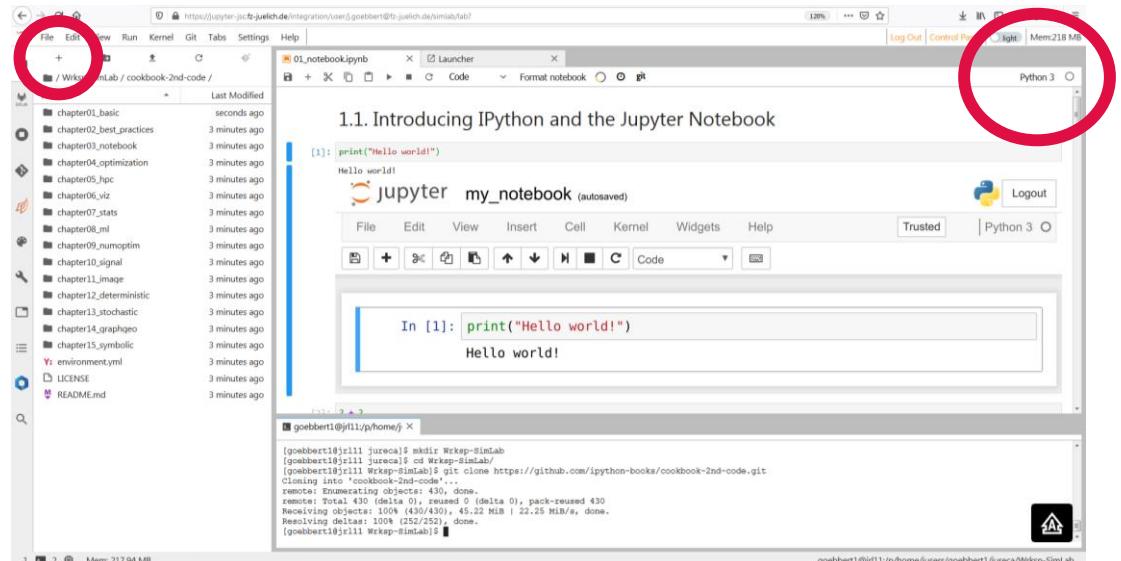

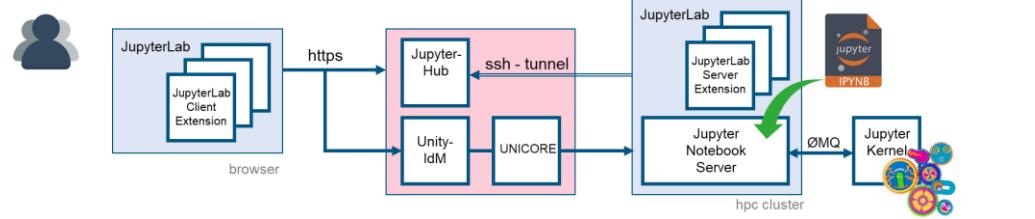

### Project kernel

*On request* Jupyter kernel can be made available to a whole project. They are installed then to

`$PROJECT/.local/share/jupyter/kernels`

[https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j\\_notebooks/-/blob/master/001-Jupyter/Create\\_JupyterKernel\\_general.ipynb](https://gitlab.version.fz-juelich.de/jupyter4jsc/j4j_notebooks/-/blob/master/001-Jupyter/Create_JupyterKernel_general.ipynb)

# JUPYTER KERNEL

## Shortcut!

You do NOT want to build your own kernel,  
every time you QUICKLY need a package or module.

You are lucky – we can show you a workaround / hack(!):

1. <https://jupyter-jsc.fz-juelich.de>
2. Click on the Github-Icon in the sidebar
3. Go to “001-Jupyter”
4. Open `Modify_JupyterKernel_at_NotebookRuntime.ipynb`

What's the trick

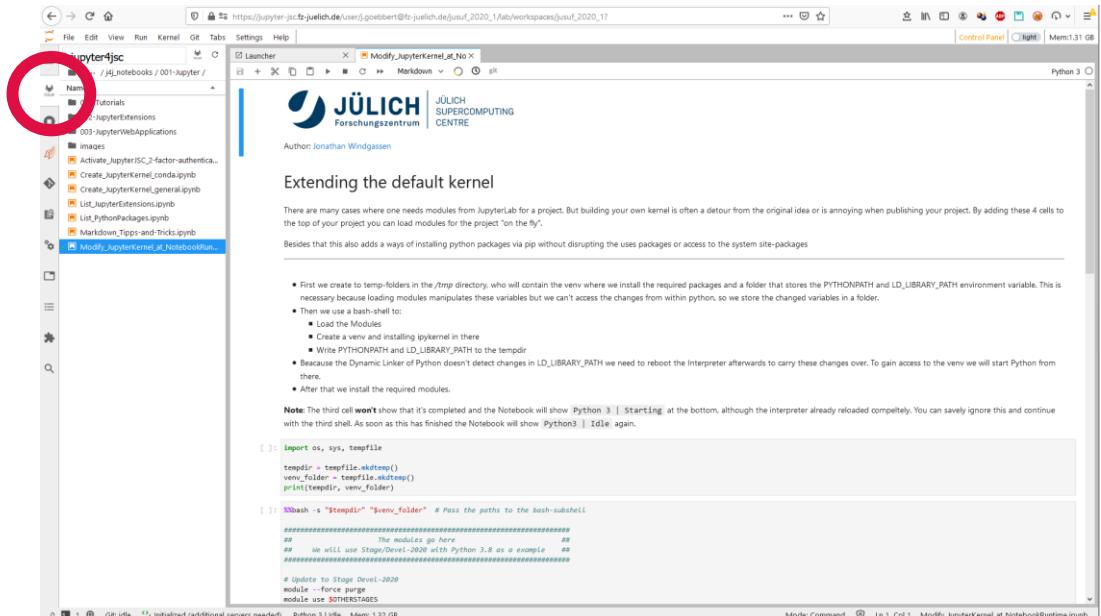

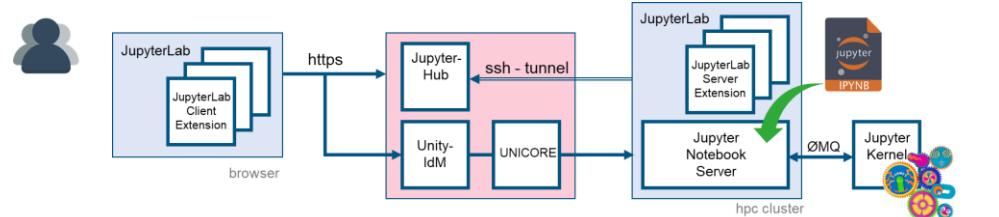

```
os.execve(f"{venv_folder}/bin/python", args, env)
```

## Workflow

1. Create a Python virtual environment at any location.
2. **WITHIN** the notebook
  - restart the kernel's python interpreter
  - of that Python virtual environment
  - with the correct environment variables set.

[https://github.com/FZJ-JSC/jupyter-jsc-notebooks/blob/master/001-Jupyter/Modify\\_JupyterKernel\\_at\\_NotebookRuntime.ipynb](https://github.com/FZJ-JSC/jupyter-jsc-notebooks/blob/master/001-Jupyter/Modify_JupyterKernel_at_NotebookRuntime.ipynb)

# JUPYTER CAN DO MORE

# JUPYTERLAB – REMOTE DESKTOP

## Run your X11-Applications in the browser

Jupyter-JSC gives you easy access to a remote desktop

1. <https://jupyter-jsc.fz-juelich.de>
2. Click on “Xpra” (not available on JURECA, yet)

### Xpra - X Persistent Remote Applications

is a tool which runs X clients on a remote host and directs their display to the local machine.

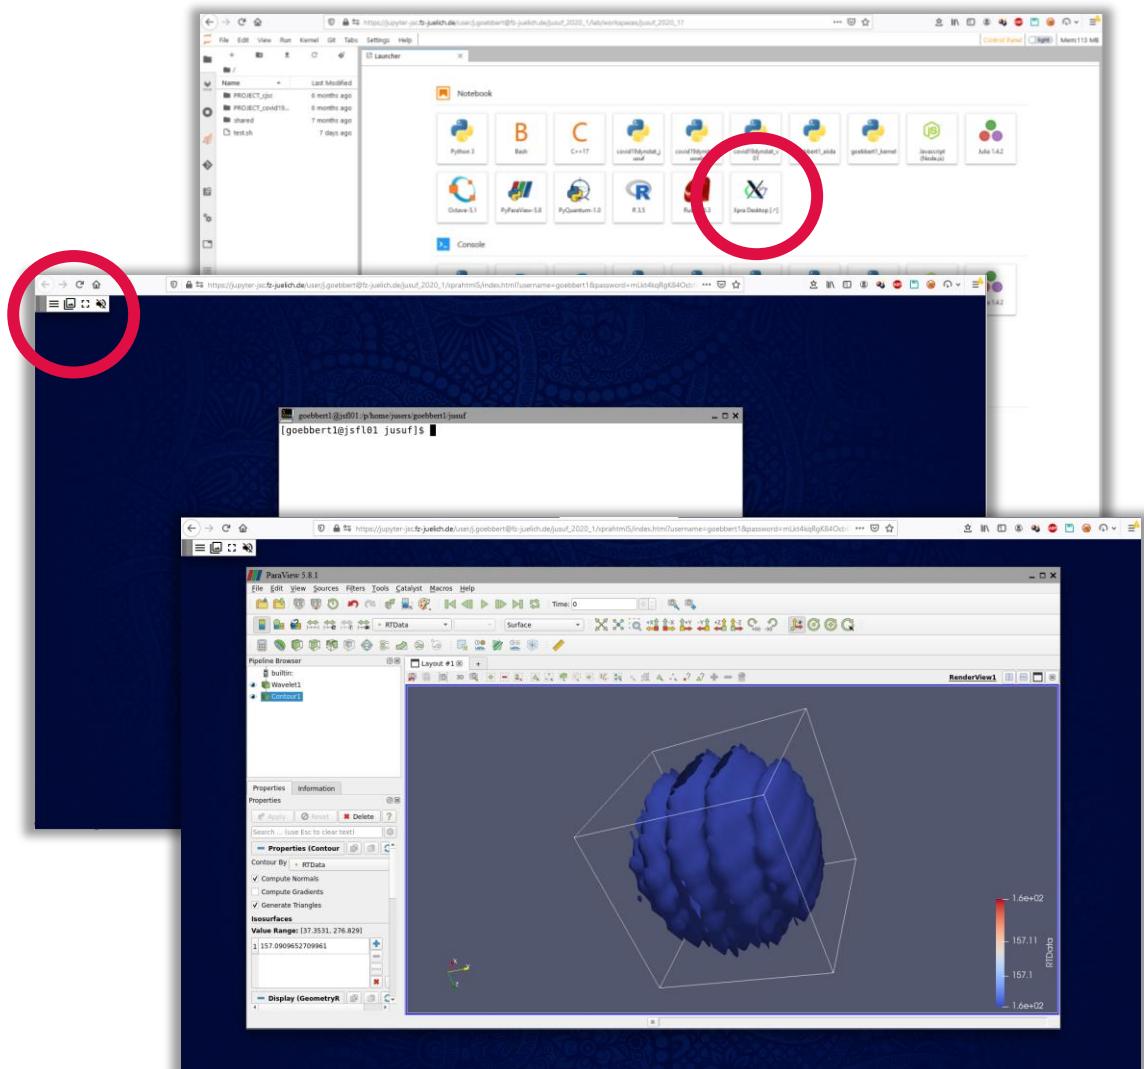

- Runs in a browser
- allows dis-/reconnection without disrupting the forwarded application
- <https://xpra.org>

The remote desktop will run on the same node as your JupyterLab does (this includes compute nodes).

It gets killed, when you stop your JupyterLab session.

#### Hint:

- **CTRL + C** -> **CTRL + Insert**
- **CTRL + V** -> **SHIFT + Insert**

# JUPYTERLAB – REMOTE DESKTOP

### Xpra - X Persistent Remote Applications

is a tool which runs X clients on a remote host and directs their display to the local machine.

- Runs in a browser
- allows dis-/reconnection without disrupting the forwarded application
- <https://xpra.org>

If the connection got lost at some point,  
just hit the “reload” button of your browser.

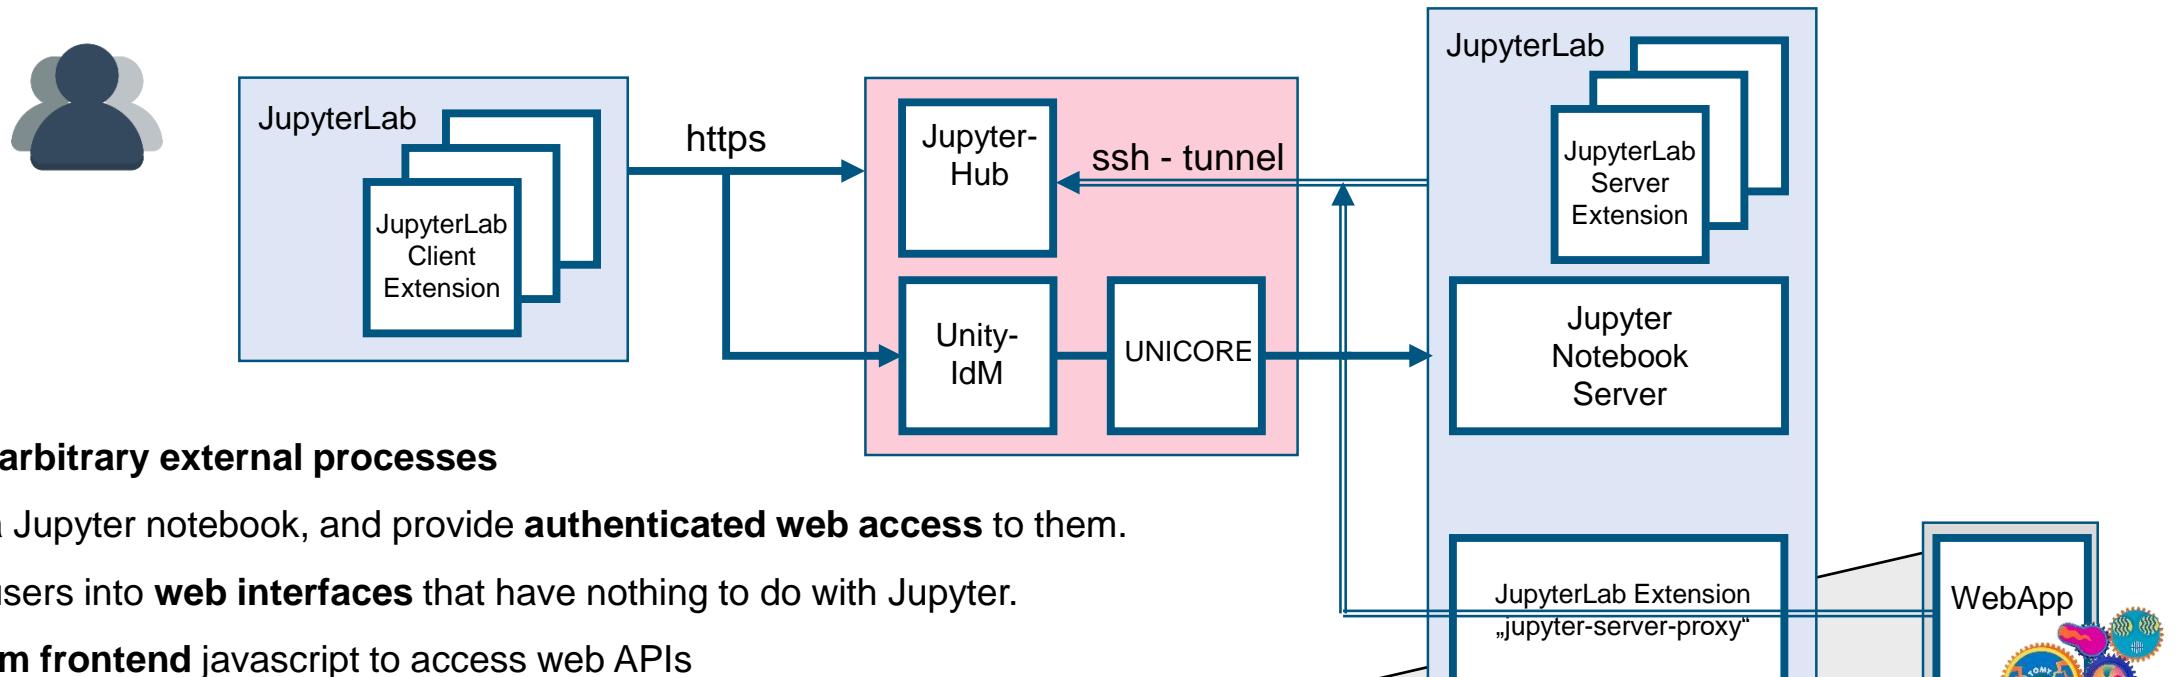

### Hint:

- **CTRL + C** -> **CTRL + Insert**
- **CTRL + V** -> **SHIFT + Insert**

# JUPYTERLAB – WEBSERVICE PROXY

## Extension: jupyter-server-proxy

Allows to run **arbitrary external processes**

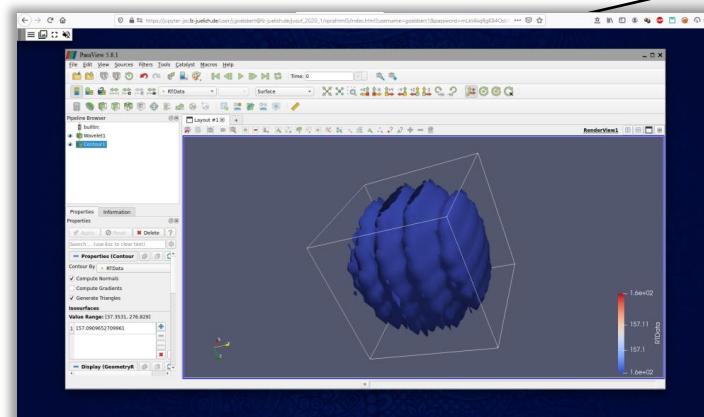

- alongside a Jupyter notebook, and provide **authenticated web access** to them.
- launching users into **web interfaces** that have nothing to do with Jupyter.
- **access from frontend javascript** to access web APIs

### Other possible examples:

TensorBoard, RStudio, Shiny, OpenRefine, custom REST-APIs, ...

# DASHBOARDS WITH JUPYTER/VOILA

Voilà turns Jupyter notebooks into standalone web applications

- **Rendering** of live Jupyter notebooks with interactive widgets with the look-and-feel of a stand-alone web app.
- Voilà disallows execute requests from the front-end, **preventing** execution of arbitrary code.
- **Enables** HPC users to develop easily web applications from their Jupyter notebooks.

# TUTORIALS

## Get started with Jupyter

Possible start to enter the world of interactive computing with IPython in Jupyter:

- Leverage the Jupyter Notebook for interactive data science and visualization
- High-performance computing and visualization for data analysis and scientific modeling
- A comprehensive coverage of scientific computing through many hands-on, example-driven recipes with detailed, step-by-step explanations

<https://ipython-books.github.io>  
<https://github.com/ipython-books/cookbook-2nd>

# BENEFITS

## Why Jupyter is so popular among Data Scientists

Some of the reasons ...

- Jupyter allows to view the results of the code in-line without the dependency of other parts of the code.
- Jupyter mixes easy for users who extend their code line-by-line with feedback attached all along the way
- Jupyter Notebooks support visualization and include rendering data in live-graphics and charts.
- Jupyter is maintaining the state of execution of each cell automatically.
- Supports IPyWidget packages, which provide standard user interface for exploring code and data interactively.
- Platform and language independent because of its representation in JSON format.
